## Introduction

Electrical drives in their many variations are now in use in every branch of industry. They determine by virtue of their characteristics the economy of production. The three-phase asynchronous motors of VEM meet the needs of users with regard to all-round versatility, superior performance parameters, environmental compatibility and high standard of reliability. VEM motors are designed for the whole of European market and offer:

- Economical performance, due to high motor efficiencies
- Versatility and reduction of stock due to series version in IP 55 degree of protection (higher degrees of protection up to IP 66 on request)
- Optional terminal box position right /on the top /left
- Increased lifetime, reliability and thermal overload capacity by series version in insulation class F with thermal reserve (special version in insulation class H on request)
- Environmental acceptability resulting from use of a low-noise ventilation system
- Supply option complying with Eastern European standards
- An alternative option for outputs according to the classic series IEC/DIN, and a progressive one based on the IEC 72 for fixing dimensions and frame sizes
- Mounting options for components, as impulse-sensors, tacho-generators, brakes, speed-sensors and forced-ventilation units for accomplishment with recent control methods according to customers' needs

Environmentally-friendly power generation, power generation by regenerative energy sources and strongly developed energy awareness are continuously increasing challenges for electric motor manufacturers.

The introduction of minimum efficiencies in some countries and the Voluntary Agreement between the EU Commission Energy and the CEMEP, the Association of European Motor and Drive Manufacturers, result in new design concepts with the special feature of energy optimisation, and finally their promotion on the market. Moreover, it is the declared objective of the Agreement to push motors with low efficiencies step by step from the market.

Taking these trends into consideration, VEM offers with the standard motors in eff2 classification and the series WE1R and W21R in eff1 classification motors which are fully matching these aims.

Further additional information is found in the Electronic Catalogue of the VEM Group. The Catalogue assists the user to select and configure the VEM products and offers the option to print out Data Sheets and Requests, to display scaled and dimensional drawings of the different products and to export them in DXF formats. Among other information about the VEM Group, also Catalogues, Lists of spare parts, Operating and maintenance manuals of the different product categories can be retrieved from the programme.

### Note:

We make all efforts to better our products. Versions, technical data and figures could be changed therefore. They are always not binding before written confirmation by the supply factory.

## Standards and regulations

The motors comply with the relevant standards and regulations, particularly with the following:

Title	DIN EN/DIN VDE	IEC
Rotating electrical machines, rating and performance	DIN EN 60034-1	IEC 34-1 IEC 85
Rotating electrical machines, Methods for determining losses and efficiency	DIN EN 60034-2	IEC 34-2
Induction motors, type IM B3, mounting dimensions and relationship frame sizes – output ratings	DIN 42673	(IEC 72)
Induction motors, type IM B5, IM B35, IM B14, mounting dimensions and relationship frame sizes – output ratings	DIN 42677	(IEC 72)
Terminal markings and direction of rotation for rotating electrical machines	DIN VDE 0530 Teil 8	IEC 34-8
Rotating electrical machines, symbols for types of construction	DIN EN 60034-7	IEC 34-7
Rotating electrical machines, built-in thermal protection	-	IEC 34-11
Rotating electrical machines, methods of cooling	DIN EN 60034-6	IEC 34-6
Rotating electrical machines, degrees of protection	DIN EN 60034-5	IEC 34-5
Rotating electrical machines, mechanical vibrations	DIN EN 60034-14	IEC 34-14
Cylindrical shaft ends for electrical machines	DIN 748 Teil 3	IEC 72
Rotating electrical machines, noise limits	DIN EN 60034-9	IEC 34-9
Rotating electrical machines, starting performance of induction cage motors up to 660 V, 50 Hz	DIN EN 60034-12	IEC 34-12
IEC standard voltages	DIN IEC 38	IEC 38
Apart from this, the following apply to EEx motors		
General regulations	DIN EN 50014 / VDE 0170/0171 T. 1	IEC 79-0
Flameproof enclosure "d"	DIN EN 50018 / VDE 0170/0171 T. 5	-
Increased safety "e"	DIN EN 50019 / VDE 0170/0171 T. 6	IEC 79-7
Type of ignition protection "n"	DIN EN 50021 / VDE 0170/0171 T. 16	
Electrical equipment for use in the presence of combustible dust	DIN EN 50281-1-1	-

In addition, VEM motors comply with various foreign regulations that are adapted to IEC 34-1

NF C 51	France	NBNC 51-101
Belgium		
ÖVE M10	Austria	CEI 2-3, V1
Italy		
NEK-IEC 34-1	Norway	BS 5000/4999
Great Britain		
SEV 3009	Switzerland (replaced by EN 60034-1)	
SS 426 0101	Sweden (replaced by EN 60034-1)	

and the Series KPER / KPR / K11R / K10R have been approved and can be supplied as specified in the regulations of the classification societies

Germanischer Lloyd	Det Norske Veritas
Lloyd's Register of Shipping	Russian Register
American Bureau of Shipping	Bureau Veritas
China Classification Society	

(In so far as motors as specified in IEC Norms are accepted) recognition of the motor series as specified by Underwriters' Laboratories Inc.® (UL), both for the electrical insulation system and for the motor construction (UL Files E216022, E216143), was achieved for the US and Canadian market. It is possible to supply the motors as specified in the electrical (not mechanical) regulations of NEMA MG1 "Motors and Generators".

Motors with Certificates in accordance with the requirements of the Energy Policy and Conservation Act (EPAct) (CSA File 184535) for the minimum efficiency legally prescribed for the USA and Canada (Table 12-10 according to NEMA and C390 according to CSA) are available.

The following permissible temperature rise applies to the standards and regulations specified:

Regulations	Cooling air temperature °C	Permissible limits of temperature rise in K (measured by resistance method) thermal class				
		A	E	B	F	H
DIN EN 60034-1	40	60	75	80	105	125

## Progressive coordination of output

VEM three phase motors with squirrel-cage rotor are available in two type series that are both based on IEC 72 with regard to their designs and frame sizes. (See Table of Motor Selection Data for type coordination). The K11R/K21R/K22R series is conceived as a classic IEC/DIN series, i.e. the fixing dimensions and correspondence of output as specified in DIN 42673/DIN 42677.

The K10R/K20R series have arisen from a progressive coordination of output in comparison with these DIN standards. They offer output up to two stages higher with the same frame size.

The variations derived from both series with different output coordination can also be supplied as special versions.

## Design version

Shaft height	Series	Housing	Material for End shields	Feet	Foot mounting
63 bis 132T	KPER/K21R				Screwed on
100 LX	KPER/K21R				Cast on
132 bis 280	K11R/K21R				Screwed on
315	K11R/K21R				Cast on
355	K22R				
56 up to 100	KPR/K20R				Cast on
112 up to 250	K10R/K20R				Screwed on
280 up to 315	K10R/K20R				Cast on

## Degree of protection

The normal version of the motors complies with degree of protection IP 55, which can be raised to IP 56, according to the order. IP 65 and higher degrees of protection are possible on request.

The motors are equipped with drain holes in the end shields (only to order in the case of shaft sizes up to 132T), which are closed with plastic stoppers.

The penetration of water along the shaft must be prevented by the user in all motors with the shaft end upwards.

In the case of flange motors in types of construction IM V3/IM V36, the collection of water in the flange end shield is prevented by a standard outlet hole. In normal cases, no special protective measures against the effects of weather are necessary for positioning outside. However, the motors must be protected against intensive solar radiation, e.g. by a protective roof, and against the fan being frozen up by a direct fall of snow, rain or ice.

## Cooling and ventilation

The motors are equipped with radial plastic or aluminium alloy fans, which cool independently of the direction of rotation of the motor (IC 411 as specified in DIN EN 60034-6).

Attention is to be paid that a minimum distance of the fan cover from the wall is maintained (dimension B1) when the motor is being installed.

Types	Materials		
	Fan		Fan cover
KPER/KPR/K21R 56-112	Plastic <sup>1)</sup>	Sheet steel	Plastic <sup>2)</sup>
K21R/K11R 132-225	Plastic <sup>1)</sup>	Sheet steel	Plastic <sup>2)</sup>
K21R/K11R 250-315L	Plastic <sup>1)</sup>	Sheet steel	
K21R 315LX2, 4	Cast aluminium alloy	Sheet steel	
K22R 355	Cast aluminium alloy <sup>3)</sup>	Sheet steel	
K20R 56-100	Plastic <sup>1)</sup>	Sheet steel	Plastic <sup>2)</sup>
K20R 112-200	Plastic <sup>1)</sup>	Sheet steel	Plastic <sup>2)</sup>
K20R 225-315L	Plastic <sup>1)</sup>	Sheet steel	
KPER 132/160 EEx e II	Plastic <sup>1)</sup>	Sheet steel	
KPER 180-315 EEx e II	Cast aluminium alloy	Sheet steel	
K11R 132-160, 180 M4, L6, 8	Plastic <sup>1)</sup>	Sheet steel	Plastic <sup>2)</sup>

<sup>1)</sup> Cast aluminium alloy possible at extra charge on request

<sup>2)</sup> Possible at extra charge for special versions

<sup>3)</sup> 2-pole with uni-directional fan

## Vibration behaviour

The permissible vibration intensities of electrical motors are specified in DIN EN 60034-14. The vibration intensity level N (normal) is achieved or bettered by VEM motors in the basic version. The vibration intensity levels (R) (reduced)

and S (special) can be supplied at extra cost dependent on type. Please consult the manufacturer.

The following values are recommended as specified in DIN EN 60034-14:

Vibration intensity levels	Speed range min <sup>-1</sup>	Limits of the vibration velocity (mm/s) in the frequency range from 10 to 1000 Hz		
		56 – 132	for sizes 160 – 225	250 – 450
N (normal)	600-3600	1.8	2.8	3.5
R (reduced)	600-1800 above 1800-3600	0.71 1.12	1.12 1.8	1.8 2.8
S (special)	600-1800 above 1800-3600	0.45 0.71	0.71 1.12	1.12 1.8

All rotors are dynamically balanced with inserted half key. This balance status is documented on the rating plate by the letter H behind the motor number; the rotor can also

be balanced with a full key if the customer prefers. In that case, the code letter behind the motor number will be F.

## Bearings / bearing lubrication

VEM motors are equipped with anti-friction bearings from respected manufacturers. The rated bearing lifetime is at least 20.000 h with the exploitation of the maximum permissible load. The rated bearing lifetime for motors installed in a horizontal position without additional axial loading is 40.000 h in the case of coupling service.

The versions

- Fixed bearing at N-end
  - Without fixed bearing (floating bearing arrangement)
  - Permanent lubrication
  - Relubrication device
  - Heavy bearing on D-end (for increased lateral forces)
  - Easy bearing arrangement
- and the
- Bearing schedules
  - Disk spring or wave washer types
  - V-ring types
  - Figures of bearing arrangements
- can be taken from the overviews of the bearing arrangements.

The respective flat grease nipples are contained in the tables of the design drawings. Motors in the normal versions with two deep groove ball bearings have preloaded bearings, where the preloading is implemented by a disk spring or a wave washer. Versions with cylindrical roller bearings on the D-end (heavy bearing arrangement VL) are excepted from the preloading.

The fixed bearing N-end version is possible in the case of motors without a fixed bearing.

Fixed bearing at D-end possible on request.

The most important prerequisite for achieving the normal bearing lifetime is correct lubrication, i.e. the use of the right kind of grease according to the application, the filling with the correct amount of grease and the maintenance of the subsequent relubrication periods.

The frame sizes 56 – 160 are equipped with life-lubricated bearings. These bearings are to be changed promptly in accordance with the usable grease life. In the case of motors from size 180, the bearings must be relubricated

promptly in accordance with the usable grease life, so that the scheduled bearing lifetime can be achieved. Under normal operating conditions, the lubrication filling will allow 10.000 operating hours for the 2-pole version and 20.000 operating hours for the 4-pole version without relubrication.

Under normal service conditions, for version with relubrication device, 2.000 or 4.000 operational hours will apply. A grease of type KE2R-40 as specified in DIN 51825 will be used as a standard grease. The used grease is to be removed from the lubrication chamber in the external bearing cover after five relubrications. Information about bearing sizes, types and quantities of lubrication and times for relubrication is to be taken from an additional plate attached to the motor.

### Use of cylindrical roller bearings

Relatively large radial forces or masses can be taken up at the end of the motor shaft by the use of cylindrical roller bearings (heavy bearing arrangement VL). Examples: belt drive, pinion or heavy couplings.

The minimum radial force at the shaft end must be a quarter of the permissible radial force. The permissible shaft end load is to be taken into account. The information can be taken from the tables and diagrams in the design selection data.

### Important Note:

If the radial force falls below the minimum value, damage to the bearings can be caused within a few hours. Test runs in no-load state only permissible for a short period.

If the minimum radial force specified is not reached, we recommend the use of grooved ball bearings (easy bearing arrangement). The bearings can be changed on request.

### Loading of the bearing and the shaft end

The design of the bearing and the shaft can only be varied within certain limits because of the international standardization of asynchronous motors. Therefore, an optimum design size has been selected.

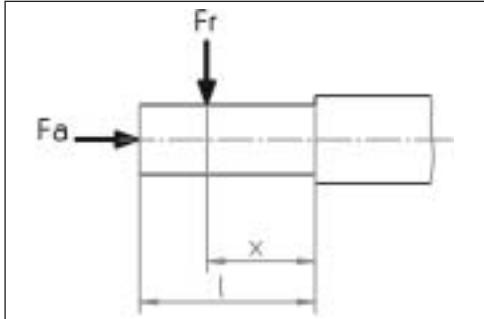

### Permissible shaft end loading

The size of the permissible shaft end loading is determined by the following principle criteria:

- permissible bending of the shaft
- shaft end fatigue strength
- bearing lifetime

The permissible shaft end loading (radial and axial forces) is based on a rated bearing lifetime of 20,000 hours and a security against fatigue failure of > 2.0.

The following figure is given as a load diagram.

$F_r$  = radial shaft end loading

$F_a$  = axial shaft end loading

$l$  = shaft end length

$x$  = distance of  $F_r$  point of application from shaft shoulder

The type-related data for the permissible axial shaft end load  $F_a$  and the permissible radial shaft end load  $F_{r0.5}$  (at application point  $x : l = 0.5$ ),  $F_{r1.0}$  (at point of application  $x : l = 1.0$ ) for the basic version and for the heavy bearing arrangement in the horizontal and vertical mounting positions of the motor are given in the tables on the respective pages. The permissible axial shaft loads for sizes 315 L and 315 LX, depending on the mounting position and the direction of the forces, are to be taken from the tables on the respective pages. The permissible radial loads for motors mounted in horizontal and vertical positions are presented in dependence on the position of the point of application (taking the direction of the radial

force in relation to gravity into account) on the shaft end. The permissible loads given apply to an installation of the motor practically free of vibration and load application planes as specified in the above presentation.

The checking of the shaft loading for size 355 will take place by the manufacturer on request.

In general, the loads  $F_r$  and  $F_a$  are dependent on the transmission members used, i.e. on the axial and radial forces occurring at these transmission members including their weights.

The forces are calculated according to mechanical formulas, e.g. for drive belt pulleys

$$F_r = 2 \cdot 10^7 \frac{P}{n \cdot D} \cdot c$$

where

$F_r$  = Radial force in N

P = Rated motor output in kW (transfer output)

n = Rated motor speed

D = Belt pulley diameter in mm

c = Pre-tension factor as stated by the belt manufacturer (preferably 2.5 in the case of V-belts)

In practice, the radial force  $F_r$  is not always effective at  $x : l = 0.5$ . The permissible radial force in the range of  $x : l = 0.5$  to  $x : l = 1.0$  can be converted by linear interpolation.

If the calculated shaft loadings are larger than those permitted, it will be necessary to change the drive members. Among others, possibilities for this can be:

- Selection of a larger belt pulley diameter
- Use of V-belts instead of flat belts
- Selection of a different pinion diameter or skew angle of the toothed wheel
- Selection of a different coupling version, etc.

In general, care should be taken as far as possible that the resulting load application point of the force  $F_r$  does not lie beyond the shaft end. However, if no solution is found, the manufacturer will be glad to check special constructions, with which problems of this sort can be solved.

### Noise behaviour

The noise measurement is carried out at design output, design voltage and design frequency, as specified in DIN EN 23741/23742. According to DIN EN 60034-9, the spatial mean value of the sound pressure level  $L_{pA}$  measured at a 1 m distance from the machine outline will be given as the noise intensity in dB(A).

The A-weighted sound power level  $L_{WA}$  at the measurement area dimension  $L_S$  ( $d = 1$  m) will be given as

$$L_{WA} = L_{pA} + L_S \text{ (dB)}$$

The measurement area dimensions will be dependent on the geometry of the machine and are for

Size	$L_S$ (dB)
56 - 132	12
160 - 225	13
250 - 315	14
355	15

The tabular value +4 dB(A) will apply as an approximate value for machines in the 60 Hz version. Binding data about 60 Hz is available on request. The noise data for the basic types is quoted in tabular form. Enquiries are necessary in the case of special series.

## Paint finish

### Normal finish

- Suitable for 'moderate' climatic group as specified in IEC 721-2-1  
Weather protected and non-weather protected locations, up to 100 % relative air humidity at temperatures up +30 °C for a short time, up to 85 % relative air humidity at temperatures up to +25 °C continuously

heavily stressed, up to 100 % relative air humidity at temperatures up +35 °C for a short time, up to 98 % relative air humidity at temperatures up to +30 °C continuously

### Paint systems

#### Sizes 56 – 132T

- all components apart from plastic parts (terminal boxes, fan cover) and aluminium terminal boxes synthetic basic primer, layer thickness ≥ 30 µm
- finish coat water-soluble paint with layer thicknesses 30 µm to 60 µm
- Special requirement dual component paint, layer thickness ≥ 30 µm

#### Sizes 132 – 355

- primer coat synthetic resin/zinc phosphate, layer thickness ≥ 30 µm
- finish layer dual component polyurethane paint, layer thickness ≥ 30 µm

### Special finish

- Suitable for the "world wide" climatic group as specified in IEC 721-2-1  
Open air positioning in atmospheres tending to be

### Paint systems

#### Size 56 – 132T

- all components synthetic basic primer, layer thickness ≥ 30 µm
- finish coat dual component paint, layer thickness ≥ 60 µm

#### Size 132 – 355

- primer coat synthetic resin/zinc phosphate, layer thickness ≥ 30 µm
- second coat on dual component basis, layer thickness 30 ≥ µm
- finish layer dual component paint, layer thickness 30 ≥ µm

### Special finishes on request

Standard colour RAL 7031 blue-grey

Additional special paint finish systems

- Version for excessive thermal stress
- Version for excessive chemical and radiation stress
- Version for extreme ambient conditions, e.g. offshore areas
- Special paint finish on customer's request

## Shaft ends

The definition of the motor ends is made in accordance to IEC 34-7:

D-end (DS): Drive end of the motor (driving side)

N-end (NS): End opposite to the drive (the side positioned opposite the DS) (Non-driving side)

Centring borings as specified in DIN 332, Sheets 1 and 2, Form DS.

The key and key ways for sizes 56 – 112 are executed as specified in DIN 6885 Sheet 1, Form A or B, and those for the sizes 132 – 355 are executed as specified in DIN 6885 Sheet 1, Form A. The key lengths for sizes 132 – 355 already comply with DIN 748 Part 3 Draft Dec. 91.

Threads for press-on and dismantling devices:

Shaft end diameters	Thread
at 7 up to 10 mm	M3
from 10 to 13 mm	M4

### Shaft end diameters

from 13 to 16 mm	Thread M5
from 16 to 21 mm	M6
from 21 to 24 mm	M8
from 24 to 30 mm	M10
from 30 to 38 mm	M12
from 30 to 50 mm	M16
from 50 to 85 mm	M20
from 85 to 130 mm	M24

The motors are always supplied with key fitted.

The second shaft end is able to transfer the full nominal output in the case of coupling drive. The output transmission capability of the second shaft end is, in the case of belt, chain or pinion drive, available on request. The drive elements with key ways, such as belt pulleys or couplings, are to be balanced with a half key inserted with a balance quality grade of at least G 6.3 as specified in DIN ISO 1949 p. 1.

## Design voltage and frequency

In the basic version, motors are supplied for the following design voltages and frequencies:

230/400 V Δ/Y	50 Hz
400/690 V Δ/Y	50 Hz
690 V Δ	50 Hz
480 V Δ	60 Hz

The motors can be operated in networks in which the voltage at the design frequency deviates from the rated

value (design voltage area A) by up to ±5 % without changing the design output. The frequency in these networks can deviate by ±2 % from the rated value in the case of the design voltage.

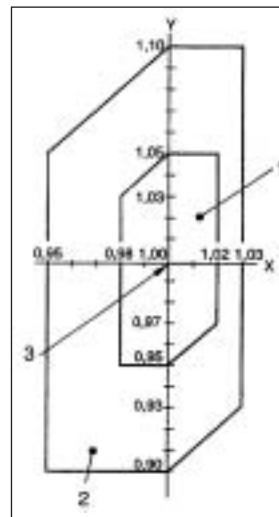

The above-given standard voltages, specified as in DIN IEC 38, will be taken as design points.

Special voltages and frequencies on customer request.

## Design voltage range, design frequency range

Motors that are to be used for mains voltage with a general tolerance of  $\pm 10\%$  as specified in DIN IEC 38 are to be selected according to the corresponding design voltage listed in the technical tables. The design voltage range restricted by  $U_u$  and  $U_o$  is also given there.

If the motors are connected to voltages between 95 % and 105 % of the design voltage range – this will correspond to the relevant mains voltage value as specified in DIN IEC 38 with  $\pm 10\%$  – it will already be permissible to exceed the permissible temperature rise of the stator winding at the frequency limits of the measuring range by approximately 10 K as specified in DIN EN 60034-1, without taking the permissible tolerances into account. For the sizes K21R 56 – 112 / K20R 56 – 100, the current at the upper voltage range  $U_o$  has been set at such a point that the motor protective switch is, even in no-load conditions and at +5 % tolerance, not triggered at the usual setting of 1.05  $I_n$ .

1 Range A  
2 Range B  
3 Design point  
x Related frequency  $f/f_N$   
y Related voltage  $U/U_N$

Voltage and frequency limits for motors  
DIN EN 60034-1

## Design output

The rated output applies to continuous operation as specified in DIN EN 60034-1, related to a coolant temperature of 40 °C and an altitude of  $\leq 1000$  m above sea level, operating frequency 50 Hz and design voltage. The series K11R/K21R and K10R/K20R have thermal reserves that enable the following type-dependent continuous loads:

- up to 10 % above the rated output at 40 °C coolant temperature, or
  - rated output up to 50 °C coolant temperature or
  - rated output at an installation altitude up to 2,500 m
- These conditions are only applicable alternatively; when more than one applies, it will be necessary to reduce output.

## Motor torque

The design torque in Nm given at the motor shaft will be

$$M = 9550 \cdot \frac{P}{n}$$

where P = design output in kW  
n = speed in r.p.m.

The starting torque, pull-up torque and pull-out torque are given as multiples of the design torques in the motor selection data tables.  
If the voltage deviates from your design data, the torques will change approximately quadratically.

## Ambient temperature

All VEM motors in the basic version in shaft heights 56 up to 132 T can be used at ambient temperatures from -20 °C up to +40 °C, in shaft heights 132 up to 355 from -40 °C up to +40 °C. Deviations from this on request. If the

fact that motors will frequently and repeatedly be exposed to dew where they are used has to be taken into account, we recommend the use of anti-condensation heating devices or other precautions.

## Overload capacity

All motors can be subjected to the following overload conditions as specified in DIN EN 60034-1:

- 1.5-fold rated current for 2 min.
- 1.6-fold rated torque for 15 sec.

Both conditions apply to rated voltage and rated frequency.

## Nominal efficiency and power factor

Efficiency  $\eta$  and the power factor  $\cos \varphi$  are given in the lists of the motor selection data.

## Restarting in the case of residual field and phase opposition

It is possible to restart all motors after a network failure with 100 % residual field.

## Motor protection

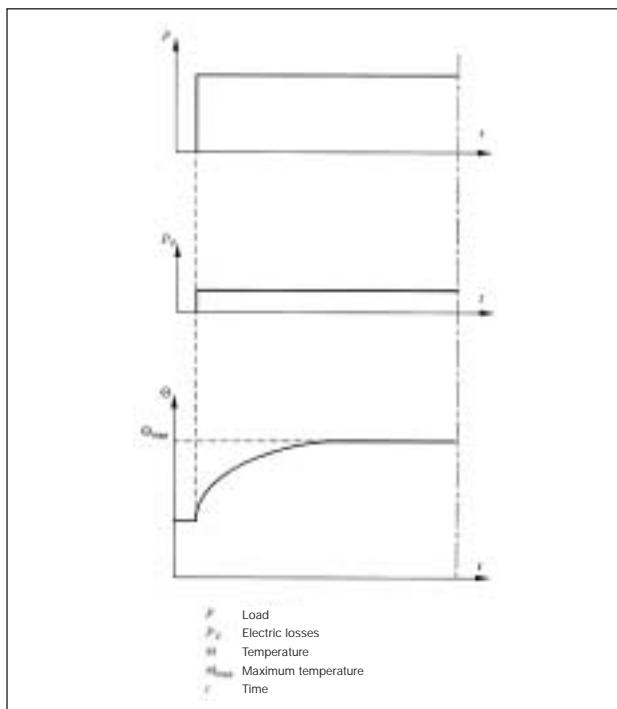

The following variations of motor protection are possible, if ordered:

- Motor protection with thermistor temperature sensors in the stator winding
- Bimetal temperature sensor as opener or closer in the stator winding

- Silicium diodes
- Resistance thermometer to monitor winding or bearing temperature
- Bearing vibration diagnosis

## Duty types

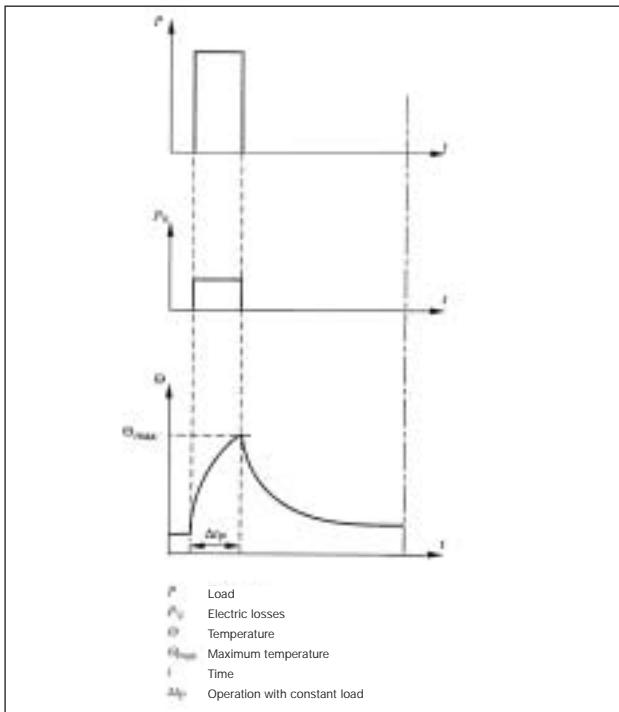

Special types of operation for switched operation, short-time operation or electrical braking are possible on request. The following nominal types of duty, which take thermal and mechanical conditions into account, are defined as specified in DIN EN 60034-1:

### Duty type S1 – Continuous duty

Operation with constant load that lasts until the machine is able to reach thermal equilibrium. If there is no indication of the duty type on the rating plate, the motor is intended for S1continuous duty.

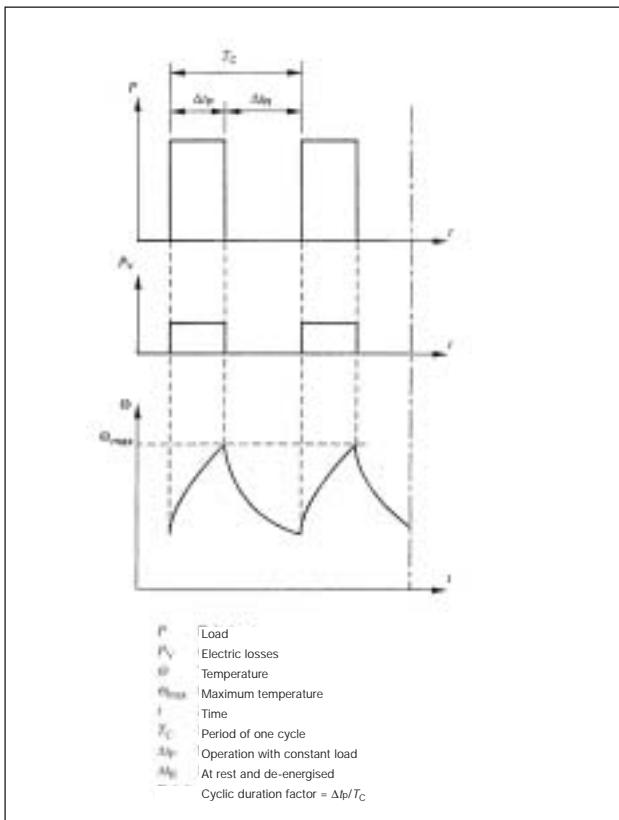

The design data for this duty type are given in the motor selection data.

### Duty type S2 – Short-time operation

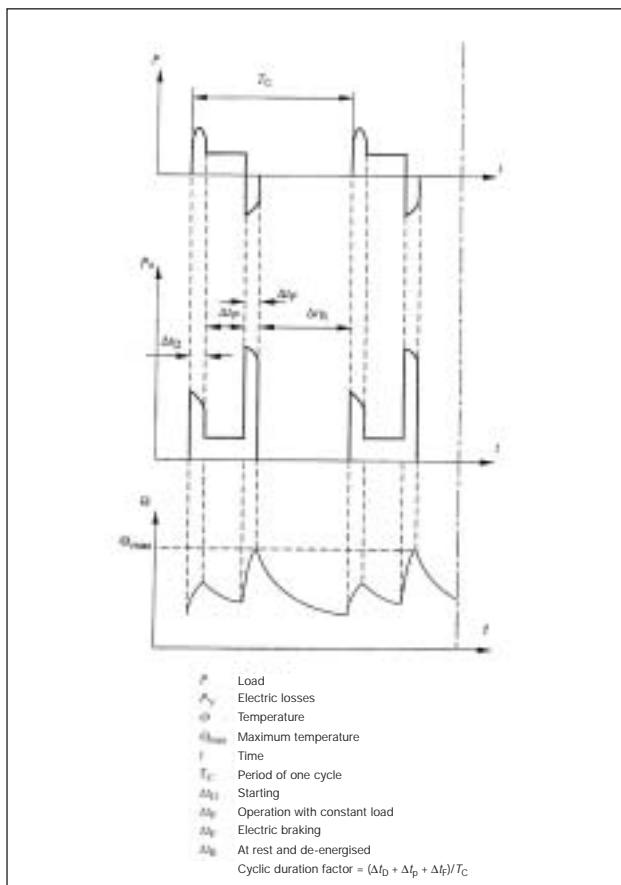

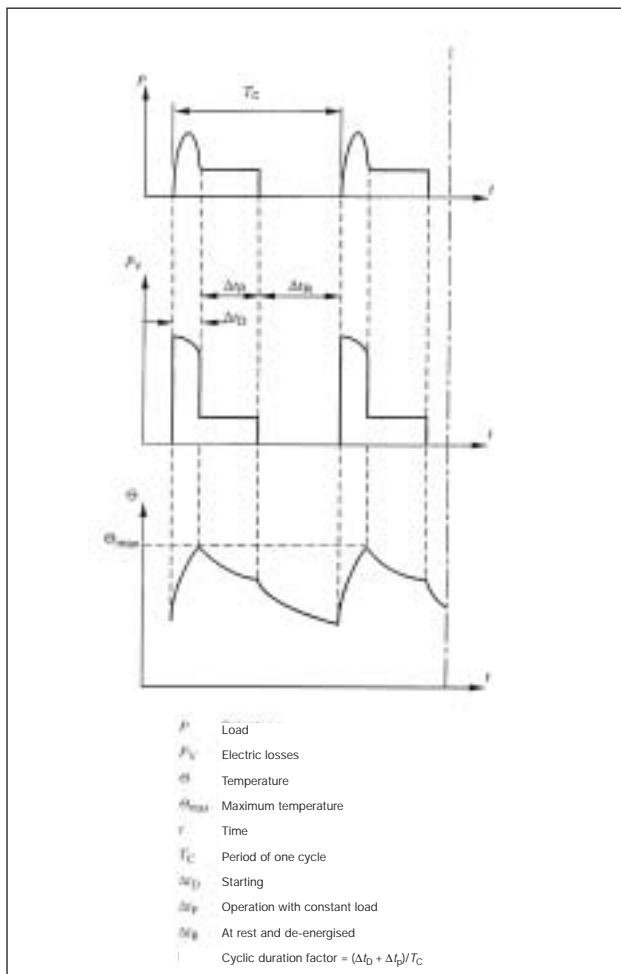

Operation at constant load not long enough to reach thermal equilibrium and a subsequent period at rest with a de-energised winding, of such a length that the again decreased machine temperature is re-established to deviate by less than 2 K from the temperature of the coolant. In the case of S2 duty type, the length of the operation period is to be given.

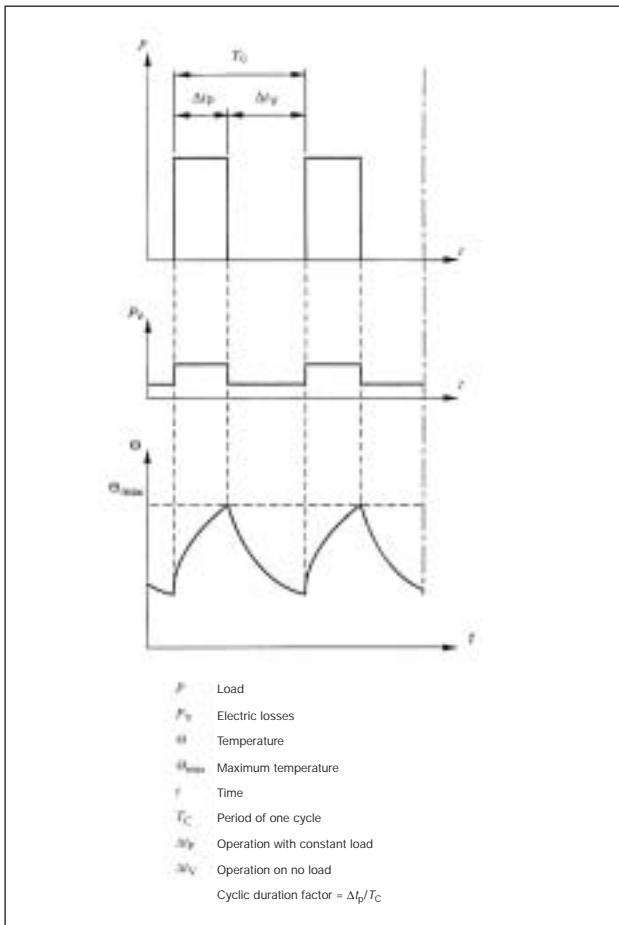

For permissible motor outputs for VEM standard motors see the "Electronic Catalogue" of the VEM Group (from Version 3.0).

### Duty type S3 – Intermittent periodic duty

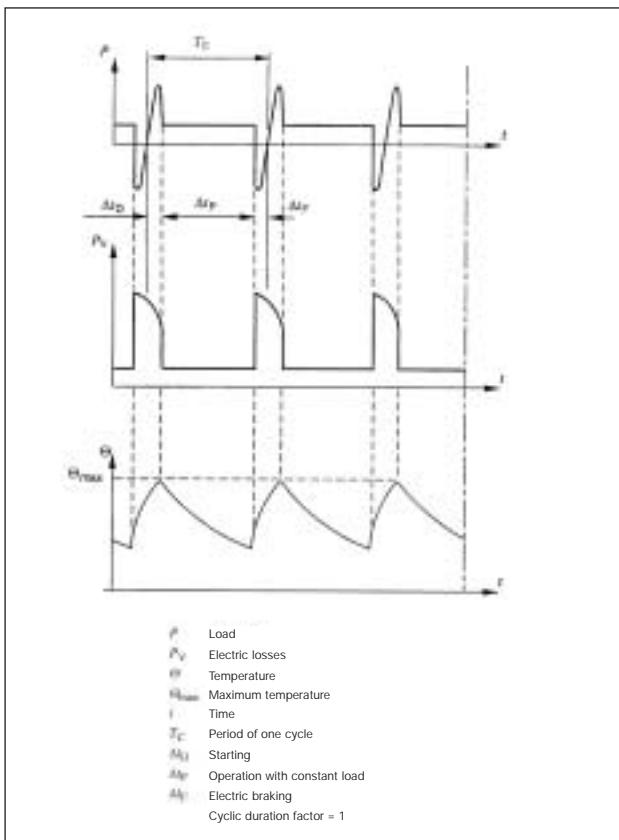

Operation that is composed of a sequence of identical cycles, each comprising an operating period at constant load and a period at rest with de-energised windings, where the starting current does not significantly affect the temperature rise. The duty type must be followed by the cyclic duration factor. Periodic operation means that a state of thermal equilibrium is not reached during the period of the load.

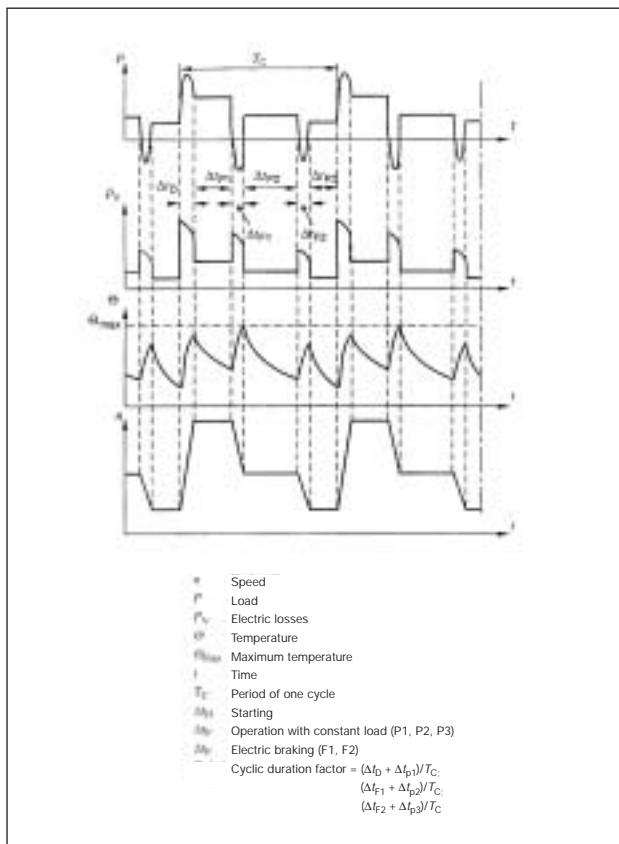

### Duty type S6 – Continuous-operation periodic duty

Operation that is composed of a sequence of identical duty cycles, each of which comprises an operating period at constant load and period of operation at no-load. No period at rest with de-energised windings occurs. The duty type must be followed by information about the cyclic duration factor. Periodic operation means that a state of thermal equilibrium is not reached during the period of the load.

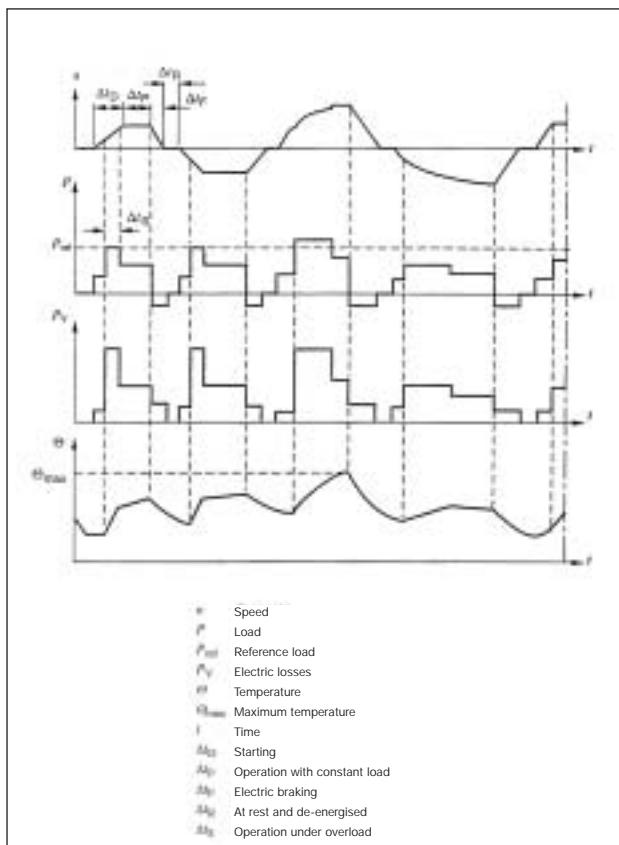

### Duty type S7 – Continuous-operation periodic duty with electric braking

Operation that is composed of a sequence of identical duty cycles, each of which comprises a starting period, an operating period at constant load and a period of electric braking. No period at rest with de-energised windings occurs. The duty type must be followed by the mass moment of inertia of the motor and mass moment of inertia of the load (both related to the motor shaft).

### Duty type S8 - Continuous-operation periodic operation with related load/speed changes

Duty type that is composed of a sequence of identical duty cycles, each of which comprises a starting period, an operating period at constant load and at a specific speed and one or more operating periods with different constant loads according to the different speeds. (For example, this will be achieved by changing the number of poles of asynchronous motors.) No period at rest with de-energised windings occurs. The information must be followed by the mass moment of inertia of the motor and of the load (both related to the motor shaft), the load, the speed and the cyclic duration factor for each speed that comes into question.

### Duty type S9 – Duty with non-periodic load and speed variations

Duty where the load and the speed generally change non-periodically within the permissible operating range. Frequently applied overloads that can lie far above the reference load frequently occur during this duty. A constant load corresponding to the S1 mode of operation will be suitably selected as the reference value for the overload in the case of this duty type.

### Duty type S10 – Duty with individual constant loads

Operation that does not contain more than four individual load values (or equivalent loads), each of which is individually maintained for sufficient time to allow the machine to achieve the state of thermal equilibrium. The smallest load within this sequence of duty cycles may occupy a value of null (no-load or rest with de-energised windings).

A constant load according to the S1 mode of operation must be suitably selected for this mode of operation as the reference value for the individual loads.

## Pole-changing motors

According to the load torque behaviour of the working machines, pole-changing motors are intended for drives with a constant load torque and those with a quadratically increasing load torque. The type of torque characteristics is given in the selection tables. The motors can only be designed for one specified voltage, e.g. 230 V, 400 V or 660 V and are generally intended for direct starting across the pole sequence. A 60 Hz version or IEC 38 special voltages are possible.

Pole-changing is achieved by

- two separate windings
- one winding in Dahlander connection
- two separate windings, one of them in Dahlander connection
- two separate windings, both in Dahlander connection

While only a speed ratio of 1:2 can be reached in the case of the winding in Dahlander connection, two separate windings offer different speed ratios, but with lower outputs in relation to the same basic version. For separate windings, Y or Δ will be executed and Δ/YY or Y/YY will be implemented for windings in Dahlander connection. Then, the connection schemes given in the lists of the motor selection data will apply in the case of the individual pole number stages. Star-delta switching can then be implemented for the highest pole number (lowest speed) if its operational connection is Δ. In the case of two separate winding with at least one winding in Δ-connection, the non-live Δ-connection must be opened. Other pole number variations are possible.

## Energy saving motors as specified in CEMEP "High efficiency" eff1 and EPAct

VEM has developed the WE1R Series on the basis of the tried and trusted K21R motor Series, using the most modern magnetic materials, special winding design and optimised bearing and ventilation. The efficiency is determined as specified in DIN EN 60034-2 / IEC 34-2, and classification in the appropriate eff classes for the European region has been established in a voluntary agreement.

The minimum regulations for efficiency of the Energy Policy and Conservation Act (EPCA) apply in the North American economic area. The determination of efficiency to be achieved (nominal and minimum values) are prescribed in the standards NEMA MG 1, Table 12-10 and CSA C390, Table 2 and 3. The determination of efficiency

must be done analogously to IEEE 112 or C390. The WE1R series fulfils the requirements as specified in EPCA. The determination of efficiency must be done as specified in IEEE 112-1996 method B. VEM Motors GmbH offers a complete WE1R ... EP, 2 and 4-pole series in a range of outputs from 1 Hp to 450 Hp at 60 Hz or to 400 Hp in the case of 50 Hz. The classification of output corresponds to that given in Standard NEMA MG1, Table 12-10. The Series is certified with File No. 184535 by CSA.

With the determination of efficiency of this motor series as specified in DIN EN 60034-2, all motors comply with the eff1 classification of the level of efficiency.

## Motors for use at frequency inverters

In principle, all squirrel-cage rotor motors from VEM can be operated at a frequency inverter. Special type-related measures are necessary in the case of a few models. Frequency inverter feeding is permissible without restrictions up to a maximum link voltage of the frequency inverter of 600 V. Thus, operation is guaranteed up to an outgoing inverter voltage of 420 V (link voltage =  $420 \cdot \sqrt{2} = 594$  V).

For inverter output voltages > 420V to 690 V, VEM offers a special KU1R series (special code Sp. 2945 or version

BAH in the case of sizes ≤ 132T), which has overall special insulation and, from size 280, has an insulated antifriction bearing on the N-end, since harmonics, asymmetries in the inverter voltage, incorrect cable run and earthing between motor and inverter can cause rotor voltages, resulting in current flow across the bearings and subsequent grease decomposition and bearing damages. The following table gives comprehensive information about the possible options of the individual series.

### Operation at a frequency inverter

Standard series K21R, K22R, K20R

Series/Shelf height	Outgoing inverter voltage	63 to 200	225 to 250	280 to 355
K21R, K22R, K20R	Up to 420 V	Permissible		
	>420 V to 690 V	Special insulation necessary		
Insulated bearing N-end		as Option	Recommended	
Forced ventilation		as Option		
Transmitter		as Option		
Transmitter mounting prepared		as Option		

Special series KU1R, KU2R, Special code Sp.2945, BAH in the case of sizes  $\leq 132T$

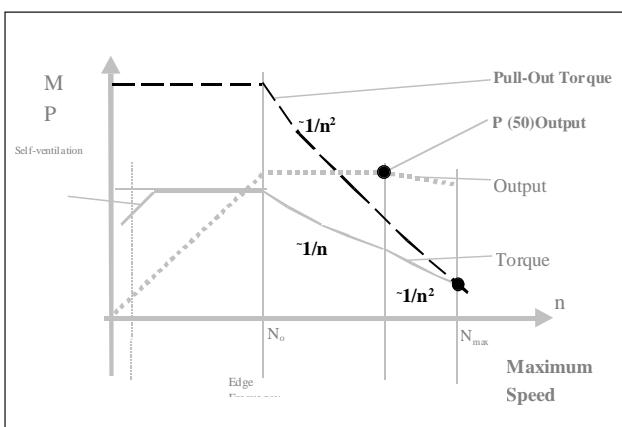

Series / shaft height	Outgoing inverter voltage	63 to 200	225 to 250	280 to 355
KU1R, KU2R	Up to 690 V	Permissible		
Special insulation		Standard		
Insulated bearing N-end		as Option	Standard	
Forced ventilation		as Option		
Transmitter		as Option		
Transmitter mounting prepared		as Option		

### Motor limits for continuous operation

The factors influencing changes to the torque and temperature behaviour of the whole drive are very diverse. They are determined both by the motor (electrical design and mechanical construction), the frequency inverter (parameters, pulse frequency, modulation behaviour) and the load conditions (torques, frequencies) required. For example, the facts of the matter can be presented in a curve of thermal limits or in an M-n characteristic curve (torque limit curve).

Higher losses in the motor in comparison to sinusoidal supply arise because of frequency inverter feeding of the drive. They must be taken into account when planning. The harmonic content created by each frequency inverter has different effects according to the electrical design of the motors, so that it is necessary, in the case of critical circumstances, where there are no planning reserves, to support the planning by measurements.

The additional remarks concern voltage source d.c. link inverters with a modern control procedure, pulse frequencies greater than 4 kHz and S1 operation. Other types must be converted to S1 operation.

P(50) Output - Frequency point, up to which the available output at 50 Hz can be demanded

### Insulation class

Full exploitation of insulation class F in the case of S1 mode of operation.

### Air stream quantity – self- (IC 411) or forced (IC 416) ventilated

Because of the different kinds of ventilation, different characteristic curves arise for drives with a continuous load torque. The cooling effect of the self-ventilation decreases in the lower speed range because of the lower quantity of air transported. For speeds above the nominal speed, increased fan noise and losses result if the original fan is used in (this is to be taken into account particularly in the case of two-pole motors).

### Stator resistance in motors of small sizes

The relatively high stator resistance plays a decisive role in small motors. This leads to the motor stalling without reaching its thermal limits.

### Countermeasures:

- Compensation for the ohmic voltage drop
- Use of frequency converters with  $I_x R$  compensation (boost)

### Mechanical speed limits

The permissible speed limits of the motors are to be taken into account in the case of operation above 50 Hz. Motors of version HS (special balancing) are to be used for operation with frequencies above 60 to 100 Hz. Motors for frequencies > 100 Hz on request.

### Pull-out torques

Reduced relative pull-out torques are permitted particularly in the case of operation above 50 Hz (field weakening area) and in the case of frequencies under 10 Hz, however  $M_K/M_N > 1.6$  is always ensured. If users need higher pull-out torques, appropriately lower torque reduction factors are to be adopted (linear conversion).

### Frequency inverter settings

#### Voltage/frequency coordination (U/f)

The linear characteristic curve ( $M = \text{constant}$ ) with auto-boost is used to adjust to the load, i.e. the optimal voltage is at every working point up to 50 Hz applied.

The fundamental voltage at the frequency inverter output (at the rated point and in the field weakening area) will be 100% of the mains voltage.

#### Modulation procedure and pulse frequency

In modern voltage source d.c. link inverters, the three-phase system is formed by sine-evaluated vector modulation. For this, the constant link voltage for the motor is split up into individual voltage blocks in such a way that the pulse period has a length corresponding to the voltage at the respective angle of the motor voltage. As a consequence, a quasi sinusoidal current will flow in the motor.

The pulse frequency is 4 kHz. The harmonic content of the current decreases with rising pulse frequency, it approximates closer and closer to the sinus shape, and additional losses in the motor are reduced.

#### Limit characteristic curve for torque

The reduction of the torque in the case of frequency inverter feeding and a constant load torque is subject to many influencing factors that differ in their weighting with different conditions of use.

For this reason, it is not possible to give a standard torque limit characteristic curve for all applications.

It will be the responsibility of project workers to undertake

an assessment of the risk factors and thus to plan an appropriate reserve.

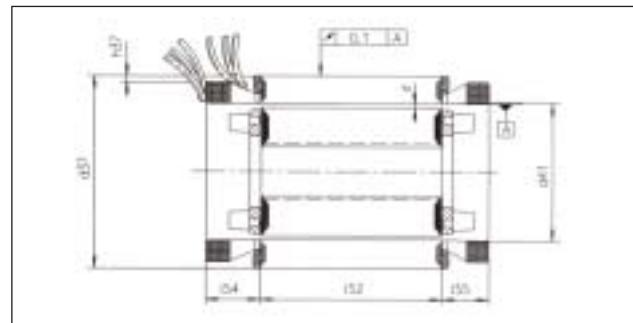

It is assumed that the operation of the motors, in relation to the noise and vibration behaviour, is possible within the investigated control range, or that an appropriate adjustment of the frequency inverter used will be made. The following influencing factors should be taken into account in a complete characteristic curve tailor-made for the relevant application, or it should contain the following information:

- Motor type (Standard or Special motor,  $M_{\text{pull-out}} / M_{\text{nominal}}$ )
- Number of poles
- Speed range with the torque required
- Frequency inverter type, pulse frequency
- Information about ventilation
- Edge frequency
- Boost (IxR compensation)
- Insulation class
- Link voltage

With special windings, for special applications, higher output and torques, if necessary, can be realised after consultation with the manufacturer.

## Built-in motors

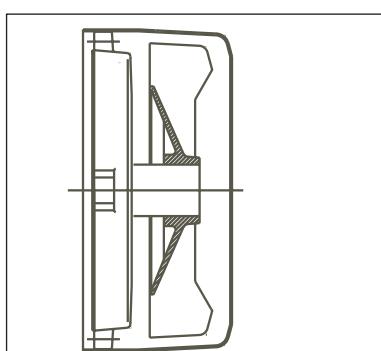

Built-in motors can be supplied for special areas of application, in which the customer provides a housing or corresponding protection against the touching of live or moving parts and mechanical influences, realised in the machine or plant that is to be driven. Components consisting of wound stator cores and complete rotors or wound stator cores and rotor bodies are available according to customer preference. Electrical data on request.

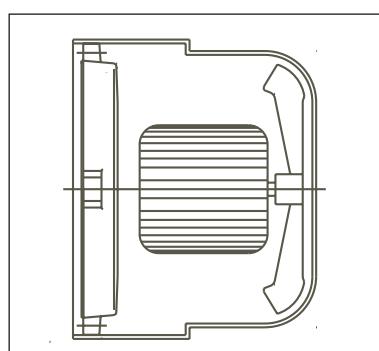

## Modular structure of the different series and modifications

The design concept of the series permits the option of adding components to solve modern control tasks, such as a pulse generator, a tachogenerator, brakes, a speed

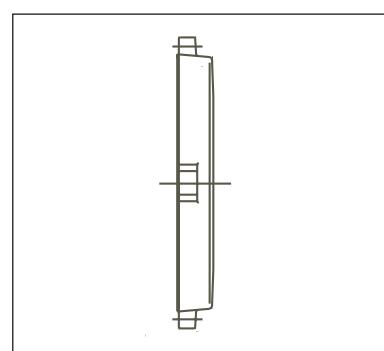

monitor and forced-ventilation units according to the customers need.

## Brake motors

VEM brake motors consist of a three-phase squirrel-cage motor and a built-on brake of appropriate manufacture. The brakes are executed as double-face disk brakes and work according to the closed-circuit principle. For example, depending on the particular version ordered, the brake systems themselves form a compact unit ready for connection and installation, where the most varied braking torques and versions can be realised according to customer preference. In principle, the brake motors have their holding torque in a dead state. For this purpose, an axial force on the axial armature pulley is exerted by compression springs, so that this force results, across friction linings, in the braking torque. The braking torque will be transmitted, across a key joint of the friction lining carrier or of a toothed driving hub, to the shaft. The armature pulley is released

by energising the brake coil and this will in turn release the friction lining carrier, so that the motor can start up.

### Information

It is possible to adapt the switching periods of the brakes by a number of different switching variations. In the basic version, the brake coil is to be driven directly, through a dual-pole connection terminal, with the appropriate coil voltage (d.c.voltage) or is driven, through the additionally supplied rectifier device, by a respective a.c. voltage. Depending on the motor size, in the special version "ready for connection", the brake coil is connected in parallel, via a rectifier device in the motor terminal box, to a phase of the motor winding.

## Motors for ship operation

Motors in the marine version are intended for driving supplementary units on board sea-going ships and satisfy the special climatic and mechanical requirements of this application field. They are designed as specified in the regulations of national and international Classification Authorities, such as Germanischer Lloyd, Det Norske Veritas, Lloyd's Register of Shipping, Russisches Register, American Bureau of Shipping, Bureau Veritas or the China Classification Society. The specific applications of the motors are an important criterion for the selection of motors in marine versions.

### Operation on deck

Motors for operation on deck are designed as type series K11W in degree of protection IP 56 without exter-

nal fan, with sizes from 112 to 180 mm. Since the motors do not have an external fan and the cooling is exclusively effected by heat radiation, outputs are reduced by approximately 30 to 40 % during continuous operation, compared to the basic series. Precise electrical data on request.

### Operation below deck

Motors for operation below deck are designed in degree of protection IP 55 for general use, e.g. in machine rooms, or in degree of protection IP 56 for use in rooms with splash water, according to the application.

## Forced-ventilated motors, cooling method IC 416

The use of forced ventilation is recommended in order to increase the motor output available in the range of lower speeds (setting range 1:5, 1:10) when operated with a frequency inverter, or to restrict the noise level when the motor is operated with frequencies > 60 Hz at a frequency inverter. According to the required degree of protection, radial (degree of protection from IP 55) or axial ventilation

units (degree of protection up to IP 55) are used. In some cases, reductions of the degree of protection can sometimes result.

On the forced-ventilation unit, there is a separate rating plate with the relevant type data. Attention must be paid to the direction of rotation when axial ventilation units are connected.

## Non-ventilated motors, cooling method IC 410

The motors are designed without their own fan and fan cover. Up to size 250, the motors have completely closed bearing covers on the N-end; from size 280, the N-end is sealed as in the basic grey cast iron version. The design output will be reduced according to the decreased cooling.

The motor windings are adjusted to this reduced output. If non-ventilated motors are installed in a stream of cooling air, different outputs are possible on request, depending on the cooling effect achieved (dependant on size indicated with ...U for sizes  $\leq$  132T).

## Explosion-protected motors

Explosion-protected operating rooms, in which potentially explosive mixtures of gas and air can occur, require the use of electrical apparatus for potentially explosive areas.

To an increasing extent, explosion-protected motors in the "increased safety" type of ignition protection represent a technically safe and commercially optimal solution for use in potentially explosive areas of Zones 1 and 2 of Device Group II, Categories 2 and 3.

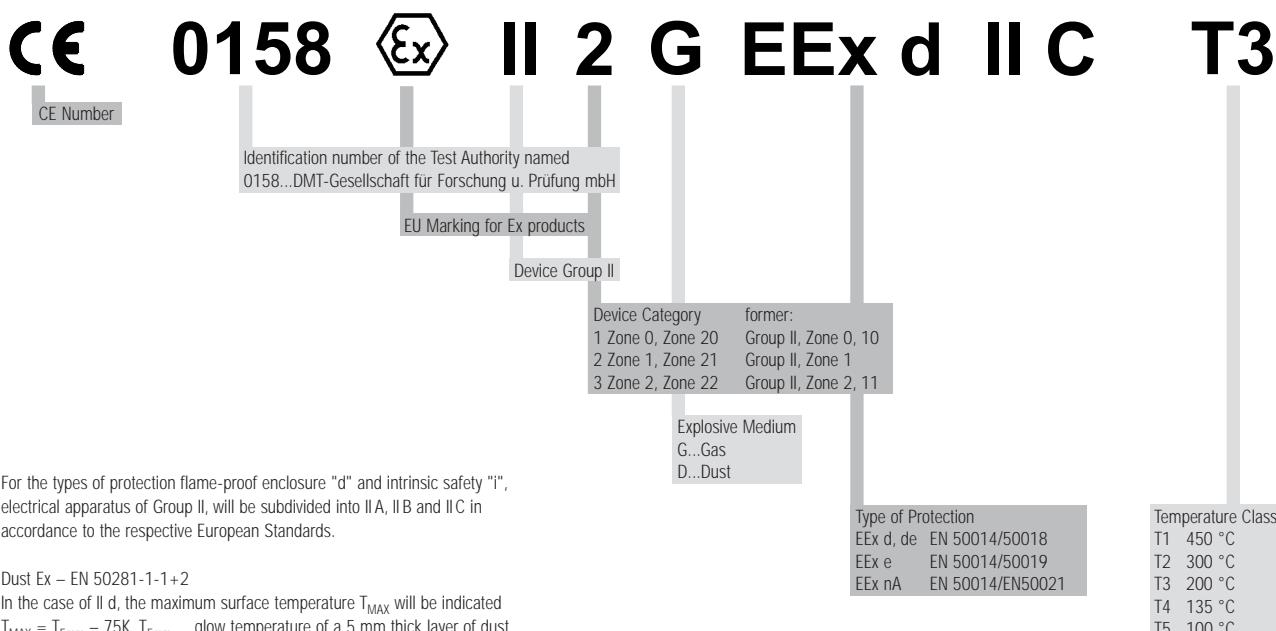

The motors of the VEM type series have been tested and certified by the Physikalisch-Technische Bundesanstalt Braunschweig [Federal physical-technical institution] (named Test Authority No. 102), the IBExU Freiberg (named Test Authority No. 0637) and the DMT Gesellschaft für Forschung und Prüfung mbH [Society for Research and Testing] (named Test Authority No. 0158). The test certificates are recognised by all member states of the European Union; members of CENELEC that do not belong to the EU also accept them. An additional or new certificate can

be necessary in the case of special versions that influence explosion protection (different frequency, output, coolant temperature, etc.).

### Directive 94/9/EG – ATEX 95 (formerly ATEX 100a)

In addition, the Physikalisch-Technische Bundesanstalt Braunschweig and the IBExU Freiberg, as named Test Authorities as identified in Article 9 of the Directive of the Council of the European Union of 23 March 1994 (94/9/EG), have certified the fulfilment of the basic safety and health requirements for the design and manufacturing of apparatus and protective systems for intended use in explosion-protected areas as specified in Appendix II of the Directive.

The quality management system is certified by the DMT Gesellschaft für Forschung und Prüfung mbH, named Test Authority No. 0158, and is monitored as specified in Article 10(1) of RL 94/9/EG.

For the types of protection flame-proof enclosure "d" and intrinsic safety "i", electrical apparatus of Group II, will be subdivided into II A, II B and II C in accordance to the respective European Standards.

Dust Ex – EN 50281-1-1+2

In the case of II d, the maximum surface temperature  $T_{MAX}$  will be indicated.  
 $T_{MAX} = T_{5mm} - 75K$ ,  $T_{5mm}$ :...glow temperature of a 5 mm thick layer of dust

### Information for planning and use

It must be left exclusively to the operator, which areas in the open air or in closed rooms are to be regarded as endangered by explosion in the sense of ATEX 137 or other relevant prescriptions or regulations; if doubts about the arrangement of potentially explosive areas arise, the decision must be left to the responsible supervisory authority.

Explosion-protected electrical machines comply with the standards of the series DIN EN 60034 (VDE 0530) and DIN EN 50014 to 50021 or DIN EN 50281-1-1. They must be used in potentially explosive areas only as specified in the instructions of the supervisory authority responsible. These authorities are responsible for the verification of the danger of explosion (zoning). The type of ignition protection, the temperature class and special conditions will be given on the rating plate or in the declaration of conformity.

### Apparatus group I, Category M2

Electrical machines with the types of ignition protection increased safety, flame-proof enclosure, pressurised apparatus, for use in mining fall into this category.

Apparatus group II, Category 2 (Zone 1 up to now)  
 Electrical machines with the types of ignition protection increased safety, flame-proof enclosure, pressurised apparatus for use in other areas endangered by a potentially explosive atmosphere fall into this category.

Apparatus group II, Category 3 (Zone 2 up to now)  
 Electrical machines with the EEx nA II type of ignition protection fall into this category.

Special conditions in the certificate of conformity are to be observed, if the certificate number is augmented by an X. The operation at a frequency inverter must be expressly certified. Attention must be paid to the separate manufacturer information. In the case of operation of motors at a frequency inverter, the motor, frequency converter and protection device must be labelled as belonging together for ignition protection type EEx e and the permissible operating data must be fixed in the joint test certificate (VDE 0165). The fact that the motor and the frequency inverter must be tested as a unit also applies to motors of ignition protection type EEx nA II.

The size of the voltage peaks created by the frequency inverter can be unfavourably affected by the connection cable installed between the frequency inverter and the electrical machine. The maximum value of the voltage peaks at the connection terminals of the machine in the system of frequency inverter – cable – electrical machine must not exceed the data specified in the separate manufacturer information.

In Germany, the erection of electrical installations in potentially explosive areas requires the observation of the following regulations:

- DIN VDE 0118      The erection of electrical installations in underground mines
- EIBergV              Electrical prescription for mining
- DIN 57165/              The erection of electrical installations in potentially explosive areas
- VDE 0165              Prescription concerning electrical installations in potentially explosive spaces
- ElexV                  Prescription concerning flammable fluids
- VbF                      Regulation concerning flammable fluids

The regulations of the country concerned are to be observed in foreign countries.

To the electrical connection, the general instructions on safety and putting into service will apply. The cable glands must be certified for the potentially explosive areas and be protected against self-activated loosening. Openings that are not used are to be closed with certified plugs.

**Protective measures against impermissible heating**  
 If no other instructions in relation to the mode of operation and tolerances are made in the test certificate or on the rating plate, electrical machines are designed for continuous operation and normally not frequently reoccurring start-ups, where no significant start-up heating arises. The motors must only be used for the mode of operation given on the rating plate.

The area A in DIN EN 60034-1 (VDE 0530, Part 1) with a voltage tolerance of  $\pm 5\%$  and a frequency tolerance of  $\pm 2\%$  and the information about the curve shape and mains symmetry must be observed, so that the temperature rise remains within the permissible limits. Wider deviations from the design values can increase the temperature rise of the electrical machine impermissibly and must be specified on the rating plate.

Each machine is to be protected against impermissible heating in all phases by a current-dependant delayed protective switch with phase failure protection as specified in VDE 0660, or an equivalent device in all phases. The protective device is to be adjusted to the design current. In the case of windings in  $\Delta$ -connection, the tripping devices will be connected in series with the winding branches and adjusted to 0.58-fold of the design current. If this connection is not possible, additional protective measures will be necessary (e.g. thermal machine protection).

In contrast to the EEx nA II protective type, the start-up is also monitored in the case of the "increased safety" protective type. Therefore, in the case of a blocked rotor, the protective device must switch off within the  $t_E$  period specified for the indicated temperature class. This requirement will be fulfilled if the tripping time, which is to be taken from the characteristic tripping curve (initial temperature  $20^\circ\text{C}$ ) for the ratio  $I_A/I_N$ , is not longer than the specified  $t_E$  period. Electrical machines for heavy start-ups (high start-up time  $> 1.7 \times t_E$  period) are to be protected by a start-up monitoring device according to the certificate of conformity.

Thermal machine protection by direct temperature monitoring of the winding is permissible if it is certified and specified on the rating plate. It will consist of temperature sensors as specified in DIN 44081/44082, which will, in association with tripping devices with the test certificate of a registered testing authority, guarantee explosion protection.

In the case of pole-changing motors, separated, mutually interlocked protecting devices are necessary for each speed. Devices with the test report of a registered testing authority are recommended.

#### Maintenance and repairs

In Germany, maintenance, repairs and changes to explosion-protected machines are to be carried out subject to the observation of ElexV/EIBergV and the safety regulations and prescriptions of the general maintenance instructions.

Work that will affect the explosion protection, which are regarded as such, e.g.

repairs to the stator or the rotor winding and at the terminals,  
 repairs to the ventilation system or  
 dismantling of flame-proof machines,  
 must be carried out at the manufacturer or by a specialist workshop for electrical machines.

The work is to be identified by an additional repair plate with the following information:

Date,  
 Executing company,  
 Type of repair, if applicable,  
 Identification of the specialist, if applicable.

If the work is not carried out by the manufacturer, it must be inspected and approved by an officially recognised specialist. This specialist must draw up a written confirmation of this and provide the machine with a test mark, respectively. In foreign countries, the regulations of the country concerned are to be observed.

## Motors for use in mechanical smoke and heat exhaust ventilators

(Fire gas version)

By means of specially modified insulation systems, bearing arrangements and connection techniques, a series for use in mechanical smoke and heat exhaust ventilators has been developed on the basis of the series K21R/K11R. Under normal conditions, these fire gas exhausting motors run as conventional fan motors and are constructed in such

a way that, in the case of a fire, they have to work according to the guideline of the customer for a specified period, subject to severely increased temperature, and are permitted to cease functioning subsequently.

The motors are classified into the categories F200 to F600 according to EN 12101-3.

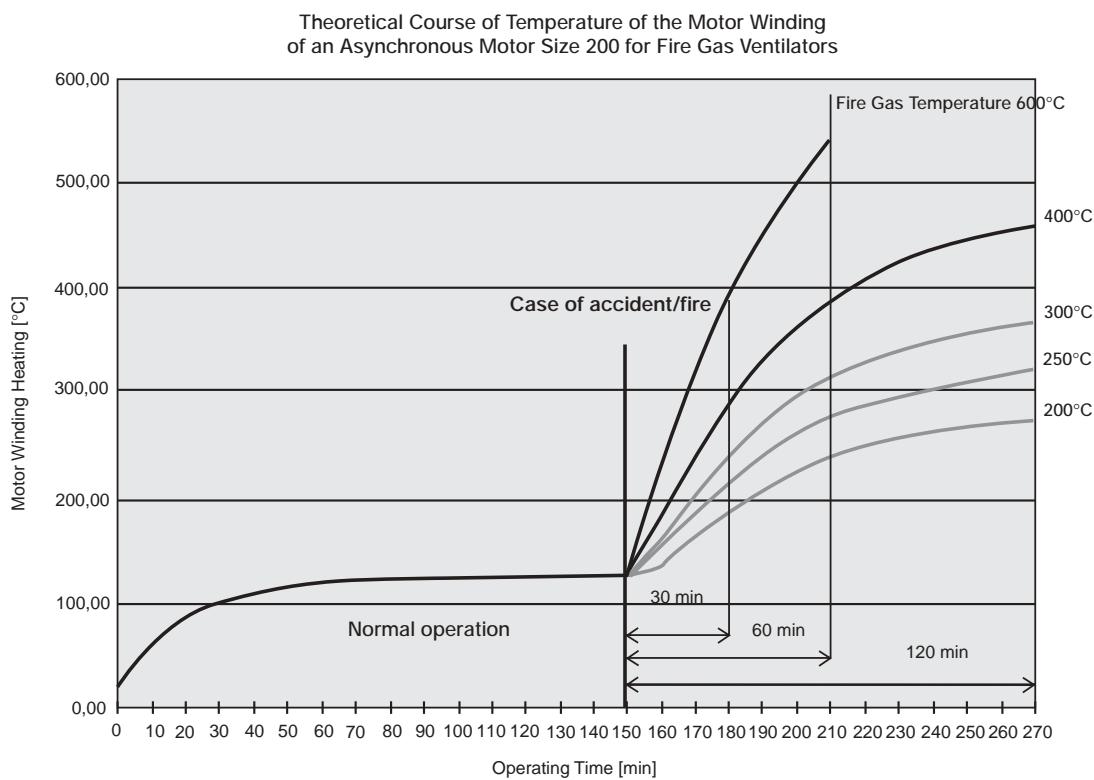

Fire gas temperature	0,5 h	Load period 1 h	2 h	Class acc. to EN 12101-3
200°C	•			
200°C		•		
200°C			•	F200
250°C	•			
250°C		•		
250°C			•	
300°C	•			
300°C		•		
300°C			•	F300
400°C		•		
400°C			•	
600°C	•			F600

However, in practice, deviating from the EN load periods are also demanded, which are then allocated to the basic class. Therefore, the most frequent periods and temperatures in practice have already been registered in the above table.

In class F200, the coordination of the motor size to the design output complies with DIN 42673/DIN 42677. In classes F300 and F400, the design outputs are reduced by approximately one stage, and the output is reduced by two stages in F600. The cause of the reduction in output lies in the use of special winding wires. Their increased diameter reduces the potential slot filling of the

motors. The motor selection data is related to self-ventilated motors with IC411 cooling method. When motors are used in jet fans or air ducts, without motor-specific self-ventilation, the fan unit will take over the cooling of the motor with a significantly higher quantity of cooling air. This offers the possibility to come to an increased output. Then, the motors will be designed for the specific customer.

The certification of the motors acc. to EN 12101-3 for classes F200 to F600 by a named Test Authority is in preparation.

In the case of an accident, the insulation system of the fire gas motors will be subjected to such extreme temperatures that these can lead to the partial disintegration of the materials. For this reason, as specified in IEC 85,

materials of heat classes F, H or 250 will be used according to the respective load temperature.  
Comprehensive information and advice on request

## VEM global version

The VEM three-phase asynchronous motors in the VEM global version have been developed specially for use in the chemical and petrochemical industry and off-shore areas. They take the extreme environmental conditions, strict requirements of safety and useful life and the special features of maintenance in this field of application into account. For the climatic conditions, the world-wide use of this electrical apparatus has been assumed. The motors can be supplied in a standard and in an explosion-protected version.

- Standard IP 55 motors
- Explosion-protected motors (certified as specified in ATEX)
  - Increased safety EEx e II 2G
  - Flame-proof enclosure EEx d/de II 2G
  - Non-sparking version EEx nA II 3G
  - Standard motors for Zone 2, Ex II 3G
  - Zone 21, Ex II 2D
  - Zone 22, Ex II 3D

The motors comply with the relevant standards and regulations for rotating electrical machines, but they also take the technical requirements of VIK (Vereinigung Industrielle

Kraftwirtschaft), the special climatic requirement of off-shore use and customer-specific requirements for the sectors of the chemical/petrochemical industry into account:

- Grey cast iron version including grey cast iron terminal boxes
- Version complying with VIK recommendation
- Offshore painting system with zinc-galvanised fan cover
- Stainless steel standard parts
- Relubrication device from size 225
- Item identification plate
- At least IP 55 type of protection
- Insulation system of insulation class F, used as specified in insulation class B
- Ambient temperature range from -40 °C to +50 °C  
(Deviations according the test certificate possible in the case of products requiring official approval)
- Vibration velocity Grade R as specified in DIN EN 60034-14
- Thermal motor protection with thermistors (PTC) standard version from size 225
- Half-key balancing
- Metric cable entries

## Tolerances – Electrical parameters

The following tolerances are permitted as specified in DIN EN 60034-1:

Efficiency (when determined indirectly)	- 0.15 (1- $\eta$ ) at $P_N \leq 50$ kW - 0.1 (1- $\eta$ ) at $P_N > 50$ kW
Power factor	$1-\cos\varphi$ at least 0.02 6 at most 0.07
Slip (at standard load in warmed-up state)	$\pm 20$ % at $P_N \geq 1$ kW $\pm 30$ % at $P_N < 1$ kW
Starting current (in the planned starting connection)	+ 20 % without lower limit
Starting torque	- 15 % and + 25 %
Pull-up torque	- 15 %
Pull-out torque	- 10 % (after application of this tolerance $M_K/M$ still at least 1.6)
Moment of inertia	$\pm 10$ %
Noise level (measurement-area related sound intensity level)	+ 3 dB (A)

Taking necessary manufacturing tolerances and deviations in materials in the case of the raw materials used into account, these tolerances are permitted for three-phase asynchronous motors. The following remarks are given in the standard:

1. A guarantee of all or any of the values as specified in the table is not mandatory. Guaranteed values to which the permissible deviations should apply must be specified expressly in tenders. The permissible deviations must comply with the table.

2. Attention is drawn to the differences in the interpretation of the concept of a 'guarantee'. In some countries, there is a differentiation between typical and declared values.
3. If a permissible deviation only applies in one direction, the value will not be limited in the other direction.

## Tolerances - Mechanical parameters

Letter codes according to DIN 42939	Meaning of the Dimension	Fit or Tolerance
a	Spacing of feet fixing holes in axial direction	$\pm 1$ mm
a <sub>1</sub>	Diameter or width across corners of the flange	- 1 mm
b	Spacing of feet fixing holes across axial direction	$\pm 1$ mm
b <sub>1</sub>	Diameter of the flange spigot	Up to diameter 230 mm j6 from diameter 250 mm h6
d, d <sub>1</sub>	Diameter of the cylindrical shaft end	Up to diameter 48 mm k6 from diameter 55 mm m6
e <sub>1</sub>	Pitch circle diameter of the mounting flange	$\pm 0.8$ mm
f, g	Largest width of the motor (without terminal boxes)	+ 2 %
h	Shaft height (lowest edge of foot to centre of shaft end)	Up to 250 mm -0.5 above 250 mm -1
k, k <sub>1</sub>	Total length of the motor	+ 1 %
p	Total height of the motor (lowest edge of foot, housing or flange up to the highest point of the motor)	+ 2 %
s, s <sub>1</sub>	Diameter of the mounting holes of the foot or flange	+ 3 %
t, t <sub>1</sub>	Lowest edge of shaft end to the upper edge of the key	+ 0.2 mm
u, u <sub>1</sub>	Width of the key	h9
w <sub>1</sub> , w <sub>2</sub>	Distance from the centre of the first foot mounting hole to the shaft shoulder or flange face	$\pm 3.0$ mm
	Distance from the shaft shoulder to the flange face in the case of fixed bearing on D-end	$\pm 0.5$ mm
	Distance from the shaft shoulder to the flange face	$\pm 3.0$ mm
	Motor mass	-5 to +10 %

nominal voltage and 50 Hz with tolerances of +3 dB.  
Noise measurement according to DIN EN 21 680 p. 1

## Types of construction

The most frequently used types of construction are shown in the following table. Other types of construction on request.

The basic type of construction is designated on the nameplate according to Code I, DIN EN 60034-7. Standard motors in sizes 56 – 200, that are ordered in the basic types of construction (universal types of construction) IM B3, IM B5 or IM B14, can also be used in the following other types of construction:

IM B3 in IM B6, IM B7, IM B8, IM V5 or IM V6,  
IM B35 in IM V15 or IM V36, IM 2051, IM 2061, IM 2071,  
IM B34 in IM 2111 or IM 2131, IM 2151, IM 2161,  
IM 2171,

IM B5 in IM V1 or IM V3,  
IM B14 in IM V18 or IM V19.

From size 225, for the types of construction IM V5, IM V6, IM B6, IM B7 and IM B8, request is required.

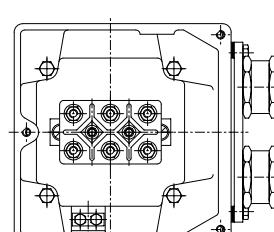

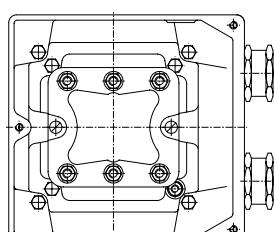

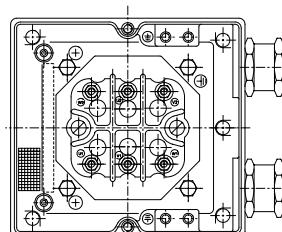

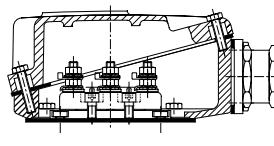

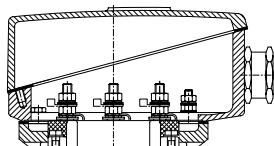

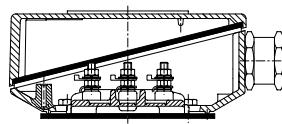

In sizes between 315 L up to 355, the types of construction IM B5 and IM V3 are not available.

To facilitate a simple and safe connection to the feeding mains, the terminal box is for all types of construction rotatable by every 90 °. For explosion protected motors in vertical types of construction with shaft end downwards, the fan cover must be equipped with a protective canopy, to prevent foreign bodies from falling into the fan area.

Basic types of construction	Other types of construction				
IM B3 IM 1001	IM V5 IM 1011	IM V6 IM 1031	IM B6 IM 1051	IM B7 IM 1061	IM B8 IM 1071
IM B35 IM 2001	IM V15 IM 2011	IM V36 IM 2031	IM 2051	IM 2061	IM 2071

## Legend for modifications summary

A = on request  
O = without extra charge  
K = not available  
N = standard version  
X = special version against extra charge

- 1) The following voltages and frequencies are standard versions:  
500 V (50 Hz)  
440 V (60 Hz)  
460 V (60 Hz)  
220/380 V (50 Hz)  
380/660 V (50 Hz)  
230/400 V (50 Hz)  
400 V (50 Hz)  
400/690 V (50 Hz)  
690 V (50 Hz)  
660 V (50 Hz)
- 2) For the shaft heights K21R 225, 250, 280  
for wall and ceiling mounting request must be made  
(welded feet version must be used).
- 3) 2-pole aluminium fan; K22R 355 / 2-pole axial fan
- 4) standard version für 2-pole motors
- 5) standard version for sizes 180 M2, L4
- 6) standard version for sizes 280, 4- up to 8pole,  
315S 4- up to 8pole,  
315M 4- up to 8pole
- 7) for sizes 132, 160 M/MX 8 and 200 L2 relubrication device  
at D-end not possible due to design version.
- 8) not possible for motors with single-face brake
- 9) special kinds of grease on request
- 10) expenses for the Classification Authorities are charged separately.
- 11) expenses for cabling are charged separately.
- 12) high-speed drives not available for sizes 315 MX2, MY2
- 13) sizes 180 M2, L4 as special versions against extra charges available
- 14) Grey cast iron fans for sizes 180 M2, 200 L, 200 LX2 against extra charges
- 15) modification according to specific customer requirements
- 16) IP 55
- 17) special series of outputs
- 18) type of mounting IM V1 only
- 19) sizes 56 - 112 as types YPE, Y21R; sizes 132 - 225 as types Y11R, Y21R
- 20) for built-in single-face and double-face brakes only available  
with additional circuitry (not ready for connection)
- 21) size 315L not available in types of mounting IM B5 and IM V3
- 22) standard version for all explosion protected motors
- 23) standard version for motors for fire and smoke exhaust fans

## **Basic version**

**Motor selection data for design voltage range A, 50 Hz, 2- up to 24pole**  
3000/1500/1000/750/600/500/375/300/250 rpm

**Motor selection data for design voltage range A, 60 Hz, 2- up to 8pole**  
3600/1800/1200/900 rpm

**3**

## **Partial load data**

**Motor selection data for design voltage range B, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Pole changing motors for two speeds**  
1500/3000 rpm      1000/3000 rpm      1000/1500 rpm  
750/3000 rpm      750/1500 rpm      750/1000 rpm  
500/3000 rpm      500/1000 rpm

**Pole changing motors for three speeds**  
750/1500/3000 rpm      750/1000/1500 rpm

**Pole changing motors for four speeds**  
500/750/1000/1500 rpm

**Built-in motors, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
K21R, mounting dimensions and output correlation acc. to DIN 42673 and 42677  
K20R, K22R, Transnorm version

**Output range**  
0,06 – 500 kW

**Sizes**  
56 – 355

**Degrees of protection**  
IP 55 acc. to DIN EN 60034-5, higher degrees of protection as an option

**Cooling method**  
IC 411 acc. to DIN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
shaft heights 56 up to 132T –20 °C up to +40 °C  
from shaft height 132 –40 °C up to +40 °C

## Three-phase motors with squirrel-cage rotor

with surface ventilation, mode of operation S1, continuous duty  
insulation class F, degree of protection IP 55

<sup>1)</sup> weights for K20R

## Three-phase motors with squirrel-cage rotor

variable speed for quadratically increasing load torque, fan drives  
 with two separate windings, Y/Y-circuit  
 with surface ventilation, mode of operation S1, continuous duty  
 insulation class F, degree of protection IP 55

<sup>1)</sup> type designation KPR remains unchanged for these components, technical state K20R is valid

<sup>2)</sup> tolerance for the fitting stator bore size 112 and lower = H7, size 132 = P7, size 160 and bigger = S7

Version with thermal sensors on request

<sup>1)</sup> Dimension for K21R

<sup>2)</sup> Dimension for K20R

## **Energy saving motors, 2- and 4-pole according to CEMEP "High Efficiency" eff 1**

**Motor selection data, 50 Hz, 2- up to 8pole  
3000/1500/1000/750 rpm**

**Series**  
WE1R, W21R  
mounting dimensions and output correlation acc. to DIN 42673 bzw. 42677

**4**

**Sizes**  
56 – 315

**Output range**  
1.1 – 90 kW, 2- and 4pole "High Efficiency" eff 1 acc. to CEMEP  
0.06 – 315 kW with increased efficiencies

**Degree of protection**  
IP 55 acc. to DIN EN 60034- 5

**Cooling method**  
IC 411 acc. to DIN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
series 56 up to 132T -20 °C up to +40 °C  
from shaft height 132 -40 °C up to +40 °C

## **Energy saving motors according to EPAct**

**Motor selection data, 60 Hz, 2- and 4pole**  
3600/1800 rpm

**Motor selection data 50 Hz, 2- and 4pole**  
3000/1500 rpm

**Series**  
WE1R ..EP  
mounting dimensions and output correlation acc. to DIN 42673 and 42677

**5**

**Sizes**  
80 – 315

**Output range**  
1.0 – 500 Hp

**Degree of protection**  
IP 55 acc. to DIN EN 60034-5

**Cooling method**  
IC 411 acc. to DIN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
shaft height 56 up to 132T -20 °C up to +40 °C  
from shaft height 132 -40 °C up to +40 °C

## Energy saving motors, High Efficiency acc. to CSA C 390 and NEMA MG 1, Table 12-10

Efficiency testing acc. to IEE 112-1996, method B  
with surface ventilation, mode of operation S1, continuous duty  
insulation class F, degree of protection IP 55, design A

## Motors for inverter feeding

Motor selection data, 50 Hz, 2- up to 8pole  
3000/1500/1000/750 rpm

### Series

K21R, KU1R, mounting dimensions acc. to DIN 42673 and 42677  
K20R, K22R, KU0R, KU2R acc. to Transnorm version  
K21F, K22F, K20F, KU1F, KU2F, KUOF – the mechanical version of the motors  
KU.R/KU.F is equal to the basic version K2.R/K2.F

### Sizes

63 – 355

**6**

### Output range

0.18 – 430 kW

### Degree of protection

IP 55 acc. to DIN EN 60034-5, higher degrees of protection as an option

### Cooling method

IC 411 (K..R) or IC 416 (K..F) acc. to DIN 60034-6

### Types of construction

IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

### Ambient temperatures

sizes 56 up to 132T -20 °C up to +40 °C

sizes 132 -40 °C up to +40 °C

## Three-phase motors with squirrel-cage rotor

surface ventilation, insulation class F(F), degree of protection IP 55

Inverter output voltage up to 420 V

\*) Field-weakening

Type designation at self-ventilation K21R, K20R, K22R

Type designation at forced-ventilation K21F, K20F, K22F

Inverter output voltage > 420 V

Type designation at self-ventilation KU1R, KU0R, KU2R

Type designation at forced-ventilation KU1F, KU0F, KU2F

## **Brake motors**

**Motor selection data 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
B21R, B20R, B22R  
Mounting dimensions and output correlation acc. to DIN 42673 and 42677

**Sizes**  
63 – 355

**Output range**  
0.18 – 500 kW

**Brakes**  
Double-face spring-pressure brakes

**7**

**Brake manufacturer and type**  
Stromag: BZFM, 4BZFM  
Lenze: BFK 458  
PINTSCH BAMAG: KFB  
Mayr: ./800.410.3  
KEB: .../08.2. 0

**Degrees of protection**  
IP 55 acc. to DIN EN 60034-5, higher degrees of protection as an option

**Cooling method**  
IC 411 acc. to DIN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
shaft heights 56 up to 132T -20 °C up to +40 °C  
from shaft height 132 -40 °C up to +40 °C

## Three-phase brake motors with squirrel-cage rotor Electromagnetic spring applied brake, series BZF./4BZFM, manufacturer Stromag

with surface ventilation, mode of operation S1, continuous duty  
insulation class F, degree of protection IP 55

## Three-phase brake motors with squirrel-cage rotor Electromagnetic spring applied brake, series BFK 458, manufacturer Lenz

with surface ventilation, mode of operation S1, continuous duty  
insulation class F, degree of protection IP 55

**Three-phase brake motors with squirrel-cage rotor  
Electromagnetic spring applied brake, series KFB/SFB,  
manufacturer Pintsch Bamag**

with surface ventilation, mode of operation S1, continuous duty  
insulation class F, degree of protection IP 55

Motor selection data

Design point 400 V, 50 Hz

## Three-phase brake motors with squirrel-cage rotor

### Electromagnetic spring applied brake, series . /800.410.3, manufacturer Mayr

with surface ventilation, mode of operation S1, continuous duty  
insulation class F, degree of protection IP 55

## Three-phase brake motors with squirrel-cage rotor Electromagnetic spring applied brake, series COMBISTOP.. .08.2. 0, manufacturer KEB

with surface ventilation, mode of operation S1, continuous duty  
insulation class F, degree of protection IP 55

Motor selection data

Design point 400 V, 50 Hz

## Motors in ship version

Motor selection data, 50 Hz, 2- up to 8pole  
3000/1500/1000/750 rpm

Motor selection data, 60 Hz, 2- up to 8pole  
3600/1800/1200/900 rpm

### Series

KPER/K11R, mounting dimensions and  
output correlation acc. to DIN 42673 and 42677  
KPR/K10R, Transnorm version

### Size

56 – 355

### Output range

0.09 up to 490 kW

### Degrees of protection

IP 55 acc. to DIN EN 60034-5, higher degrees of protection as an option

### Cooling method

IC 411 acc. to DIN 60034-6

### Types of construction

IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

### Ambient temperatures

acc. to Classification Authorities

The motors have been manufactured and tested and  
are available according to the Rules of the following Classification Authorities

Germanischer Lloyd

Det Norske Veritas

Lloyd's Register of Shipping

Russian Register

American Bureau of Shipping

Bureau Veritas

China Classification Society

## Three-phase motors with squirrel-cage rotor for sea-going vessels

## **Forced-ventilated motors, cooling method IC 416**

**Motor selection data, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
K21F, K20F, K22F  
mounting dimensions acc. to DIN 42673 and 42677

**Sizes**  
63 – 355

**Output range**  
0.09 – 500 kW

**Forced-ventilation unit**  
version with axial fan  
version with radial fan

**Degrees of protection**  
IP 55 nach DIN EN 60034-5, for version with radial fan higher degrees of protection as an option

**9**

**Cooling method**  
IC 416 acc. to DIN 60034-6

**Type of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
shaft heights 56 up to 132T -20 °C up to +40 °C  
from shaft height 132 -40 °C up to +40 °C

## Three-phase motors with squirrel-cage rotor

forced-ventilated version, cooling method IC 416

mode of operation S1, continuous duty, insulation class F, degree of protection IP 55

Motor selection data

Design point 400 V, 50 Hz

## **Non-ventilated motors, cooling method IC 410**

**Motor selection data, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
K210  
fixing dimensions acc. to DIN 42673, 42677  
K200, K220  
Transnorm version

**Sizes**  
56 – 355

**Output range**  
0.04 – 250 kW

**Degrees of protection**  
IP 55 acc. to DIN EN 60034-5, higher degrees of protection as an option

**Cooling method**  
IC 410 acc. to DIN 60034-6

**Types of mounting**  
IM B3, IM B35, IM B5 and derived types of mounting acc. to DIN EN 60034-7

**Ambient temperatures**  
Sizes 56 up to 132T -20 °C up to +40 °C  
From size 132 -40 °C up to +40 °C

## Three-phase motors with squirrel-cage rotor

non-ventilated with surface cooling, cooling method IC 410

mode of operation S1, continuous duty, insulation class F, degree of protection IP 55

Motor selection data

Design point 400 V, 50 Hz

## **Explosion protected motors for type of protection "Increased safety", EEx e II 2G**

**Motor selection data for design voltage range A, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Motor selection data for design voltage range A, 60 Hz, 2- up to 8pole**  
3600/1800/1200/900 rpm

**Motor selection data for wide design voltage range A, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Summary EG certificates of conformity and EG certificates of sample tests**

### **Series**

KPER/K11R/K12R

Mounting dimensions acc. to DIN 42673 sh. 2 and DIN 42677 sh. 2,

KPR/K10R

Transnorm version on request

### **Sizes**

63 – 355

### **Power range**

0.12 – 335 kW

### **Degrees of protection**

IP 54, IP 55, IP 56, IP 65 acc. to DIN EN 60034-5

### **Cooling method**

IC 411 acc. to DIN EN 60034-6

### **Types of construction**

IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

### **Ambient temperatures**

-40°C up to +40°C (depending on the Certificate, deviations possible)

### **Explosion-protected version in accordance to Apparatus Group II, Category 2**

EN 50 014 (DIN VDE 0170/0171 part 1) General Requirements

EN 50 019 (DIN VDE 0170/0171 part 6) Increased safety "e"

Temperature class T1 up to T3; T4 available on request

The motor design version is certified in an EG-Sample Test Certificate.

## Three-phase motors with squirrel-cage rotor

**Increased-safety type of protection EEx e II acc. to DIN EN 50014/50019**

for design voltage, temperature classes T1, T2 and T3

with surface ventilation, mode of operation S1, continuous duty

insulation class F, degree of protection IP 55

**Explosion protected motors for  
type of protection "Flame-proof enclosure", EEx d II 2G / EEx de II 2G** 

**Motor selection data, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
K8.R  
mounting dimensions and output correlation acc. to DIN 42673 sh. 3 and 42677 sh. 3

**Sizes**  
56 – 355

**Output range**  
0.12 – 630 kW

**Degrees of protection**  
IP 55, IP 56 acc. to DIN EN 60034-5

**Cooling method**  
IC 411 acc. to DIN EN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
-20 °C up to +60 °C

**Temperature classes**  
T3 up to T6

**12**

**Explosion-protected version in accordance to Apparatus Group II, Category 2**

EN 50 014 (DIN VDE 0170/0171 p. 1) General Requirements  
EN 50 018 (DIN VDE 0170/0171 p. 5) Flame-proof enclosure "d"

The motor design version is certified in an EG-Sample Test Certificate.

## Three-phase motors with squirrel-cage rotor, Flame-proof enclosure type of protection EEx d, de II according to DIN EN 50014/50018

for design voltage, temperature class T4

with surface ventilation, mode of operation S1, continuous duty

insulation class F, degree of protection IP 55

Other voltages and frequencies on request

**Explosion protected motors for  
type of protection "Non-sparking", EEx nA II 3G** 

**Motor selection data, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
KPER/K11R/K12R  
mounting dimensions and output correlation acc. to DIN 42673 sh. 1 and DIN 42677 sh. 1  
KPR/K10R  
Transnorm version on request

**Size**  
63 – 355

**Output range**  
0.06 – 450 kW

**Degrees of protection**  
IP 54, 55, 56, 65 acc. to DIN EN 60034-5

**Cooling method**  
IC 411 DIN EN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
-40°C bis +55°C (depending on the Certificate, deviations possible)

**Temperature class**  
T1 up to T3

**13**

**Explosion-protected version in accordance to Apparatus Group II, Category 3**  
EN 50 014 (DIN VDE 0170/0171 p. 1) General Requirements  
EN 50 021 (DIN VDE 0170/0171 p. 16) Protective system "n"

The motor design version is certified in an EG-Sample Test Certificate.

## Three-phase motors with squirrel-cage rotor

Motors for the use in zone 2, type of protection "Non-sparking EEx nA II"  
 acc. to DIN EN 50014/50021, temperature classes T1 – T3  
 with surface ventilation, mode of operation S1, continuous duty  
 insulation class F, degree of protection IP 55

max. T: maximum surface temperature (rotor included)

**Motors for use in areas with occurrence of combustible dust**  
**Motors for use in Zone 21, Ex II 2D**

Motor selection data, 50 Hz, 2- up to 8pole  
3000/1500/1000/750 rpm

Series  
KPER/K21Q  
mounting dimensions and output correlation acc. to DIN 42673 sh. 1 and 42677 sh. 1  
KPR/K20Q  
Transnorm version on request

Sizes  
56 – 315

Output range  
0.06 – 315 kW

Degree of protection  
IP 65 acc. to DIN EN 60034-5

Cooling method  
IC 411 acc. to DIN 60034-6

Types of construction  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

Ambient temperatures  
-40 °C bis +40 °C (depending on the Certificate, deviations possible)

Explosion-protected version in accordance to Apparatus Group II, Category 2  
EN 50 014 (DIN VDE 0170/0171 p. 1) General Requirements  
EN 50281-1-1 (DIN VDE 0170/0171 p. 15) Areas with combustible dusts

The motor design version is certified in an EG-Sample Test Certificate.

## Three-phase motors with squirrel-cage rotor

Motors for the use in zone 21 acc. to DIN EN 50014/50281-1-1 and -1-2

with surface ventilation,

mode of operation S1, continuous duty

insulation class F, degree of protection IP 65

version for design voltage range A acc. to IEC 34-1, 50 Hz

max. surface temperature 125 °C

Motor selection data

Series K21Q also available as series K200

**Motors for use in areas with occurrence of combustible dust**  
**Motors for use in Zone 22, Ex II 3D**

**Motor selection data, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
KPER/K21R  
mounting dimensions and output correlation acc. to DIN 42673 sh.1 and DIN 42677 sh.1  
KPR/K20R  
Transnorm version on request

**Sizes**  
56 – 355

**Output range**  
0.09 – 450 kW

**Degree of protection**  
IP 55 acc. to DIN EN 60034-5  
IP 65 acc. to DIN EN 60034-5 for conductive dusts

**Cooling method**  
IC 411 acc. to DIN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
-40 °C up to +40 °C  
(depending on the Certificate, deviations possible)

**Explosion-protected version in accordance Apparatus Group II, Category 3**  
EN 50 014 (DIN VDE 0170/0171 p. 1) General Requirements  
EN 50281-1-1 (DIN VDE 0170/0171 p. 15) Areas with combustible dust

The motor design version is certified in a Manufacturer's Declaration of Incorporation.

## Three-phase motors with squirrel-cage rotor

Motors for the use in zone 22 acc. to DIN EN 50014/50281-1-1 and -1-2

with surface ventilation,

mode of operation S1, continuous duty

insulation class F, degree of protection IP 55

version for design voltage range A acc. to IEC 34-1, 50 Hz

max. surface temperature 125 °C

## **Motors for use in powered smoke and heat exhaust ventilators - Fire gas version**

**Motor selection data, 50 Hz, 2- up to 8pole**  
3000/1500/1000/750 rpm

**Series**  
K21R/K11R/K22R  
mounting dimensions and output correlation acc. to DIN 42673 sh. 1 and 42677 sh. 1

**Sizes**  
56 – 355

**Output range**  
0.09 – 450 kW

**Degree of protection**  
IP 55 acc. to DIN EN 60034-5

**Cooling method**  
IC 411 acc. to DIN 60034-6

**Types of construction**  
IM B3, IM B35, IM B5 and derived types of construction acc. to DIN EN 60034-7

**Ambient temperatures**  
shaft height 56 up to 132T -20 °C up to +40 °C  
from shaft height 132 -40 °C up to +40 °C

**Fire gas classification**  
in accordance to DIN EN 12101-3,  
F200, F300, F400 and F600

The motor version is certified by a Declaration of Incorporation.

## Three-phase motors with squirrel-cage rotor for use in mechanical smoke and heat exhaust ventilators – Fire gas version

with surface ventilation, mode of operation S1, continuous duty

insulation class F, degree of protection IP 55

Design point 400 V, 50 Hz

### **Spare parts summary**

#### **Survey of spare parts K2.R 56 up to 132T**

#### **Survey of spare parts K1.R, K2.R, KU.R 112 up to 355**

#### **Responsibility for the delivery of spare motors and spare parts**

Spare parts available up to 5 years after phase-out of a series

After more than 5 years, VEM gives technical information about the whole motor, and components respectively and supplies, if requested, spare parts (if still available) or technical documents for manufacturing of spare parts.

#### **Data for spare parts order**

Ordering spare parts, the following data must be specified:

Motor designation and Motor number (Factory number)

Designation of the component

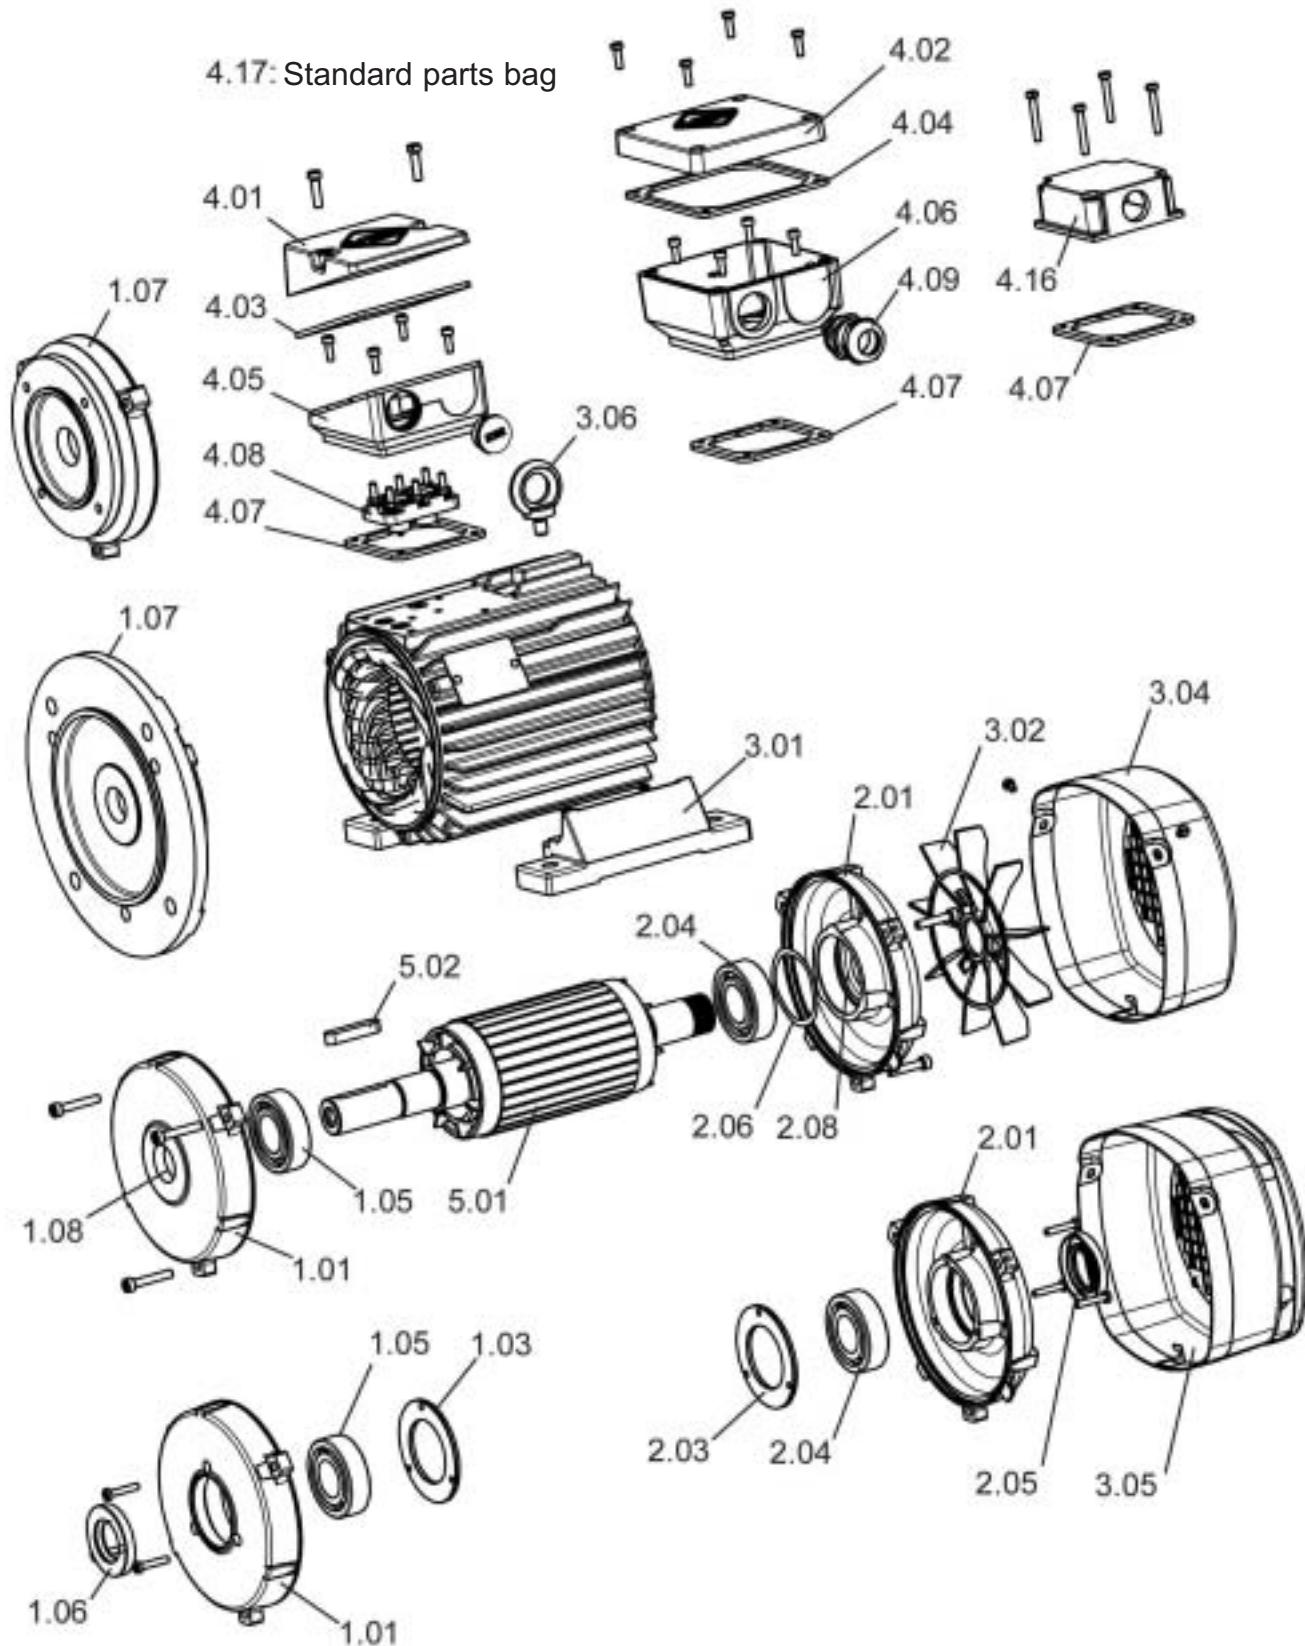

Year of manufacturing

## Spare parts summary

Item No.	Designation
1.01	End shield D-end
1.02	Bearing cover, D-end, external
1.03	Bearing cover, D-end, internal
1.04	Disc spring / wave washer, D-end, not for roller bearings
1.05	Antifriction bearing D-end
1.06	V-ring D-end
1.07	Flange end shield
1.08	Felt ring D-end
2.01	End shield N-end
2.02	Bearing cover, N-end, external
2.03	Bearing cover, N-end, internal
2.04	Antifriction bearing N-end
2.05	V-ring N-end
2.06	Disc spring N-end (or D-end)
2.08	Felt ring N-end
3.01	1 pair of motor feet
3.02	Fan
3.03	Fan cowl, plastics
3.04	Fan cowl, sheet steel
3.05	Fan cowl with canopy
3.06	Lifting eye bolt
4.01/4.02	Terminal box cover
4.03/4.04	Terminal box cover gasket
4.05/4.06	Terminal box base
4.07	Terminal box base gasket
4.08	Terminal plate
4.09	Cable gland
4.10	Screw plug
4.11	Cable gland for thermal winding protection
4.12	Terminal for thermal winding protection
4.13	Clamp
4.14	Sealing components
4.15	Adapter plate
4.16	Flat terminal box
4.17	Standard parts bag
5.01	Rotor, complete
6.01	Grease thrower ring, D-end
6.02	Grease thrower ring, N-end
6.03	Labyrinth gland, D- and N-end
6.04	Guide disc, D-end
6.05	Guide disc, N-end

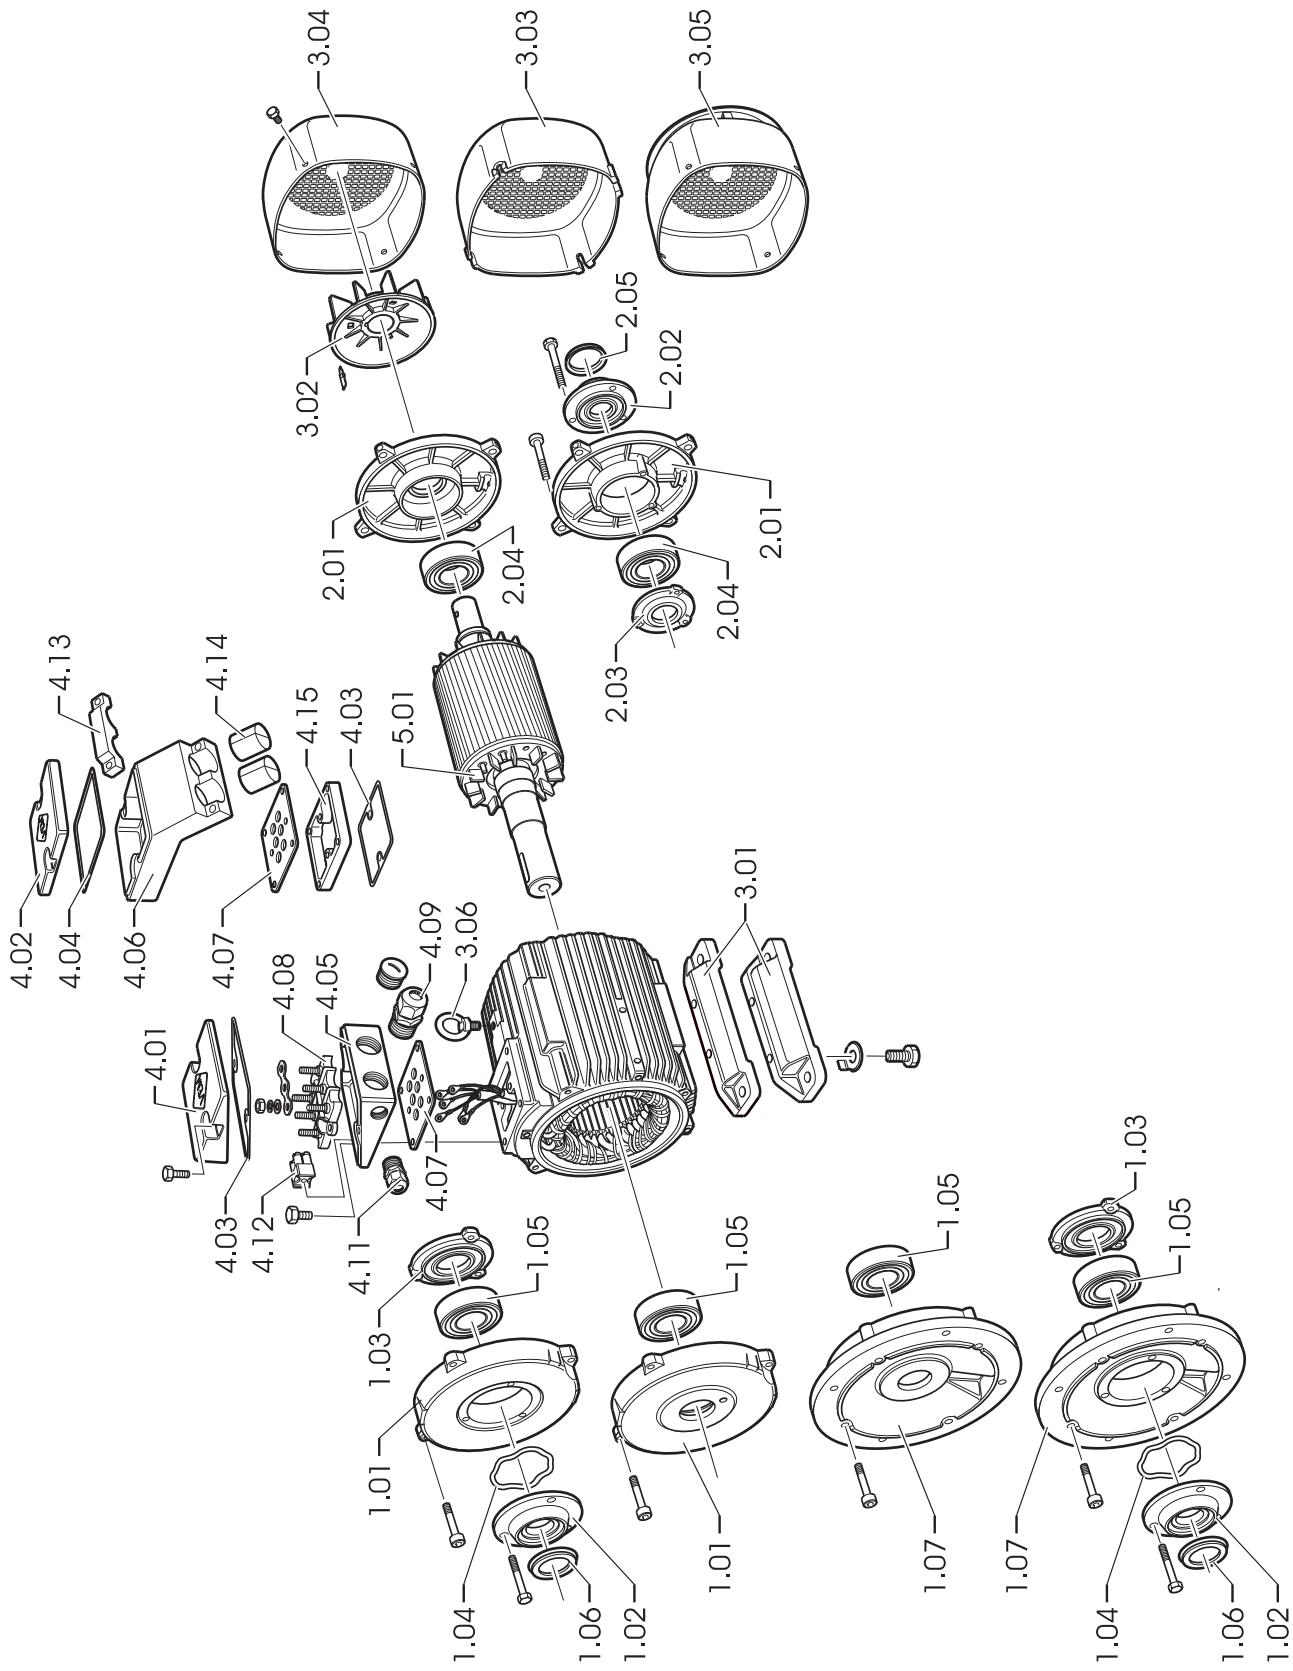

## Three-phase asynchronous motor with squirrel-cage rotor, basic version K2.R 56 – 132T

(example, delivered version may differ in details)

**Three-phase asynchronous motor, basic version K1.R/K2.R 112 – 355**

(example, delivered version may differ in details)
